ADDENDUM

What's new in PowerLogic ION7550/ION7650 v400

Firmware version 400 (v400) for PowerLogic™ ION7550/ION7650 meters provides the following support and updates:

Firmware v400 support

Firmware v400 and higher provide support for ION7550/ION7650 meters using new internal hardware. Any firmware versions lower than v400 are not supported on the new meters, but all existing features from the last firmware release (v373) have been carried forward in v400.

To determine if your meter supports v400, find the serial number by looking at the label on the top of your device, then refer to the sample serial number below:

PJ-0602A267-05

If your meter's serial number ends in -05 or higher, v400 is supported on your meter.

The serial number can also be located on the Nameplate screen on the meter's front panel display, read using ION Setup connected to your meter, or from the meter's web pages.

Removal of firmware variants in v400

Prior to firmware v400, there were two variants of each firmware version available: the 'e' variant with IEC 61850 implementation and the 's' variant without the IEC 61850 implementation. Firmware v400 has a complete set of features that incorporates both variants into a single firmware version.
