Introducing Motor Management by Schneider Electric

Up to

20%

investment savings
thanks to the suitable
voltage level.

A

Up to

30%

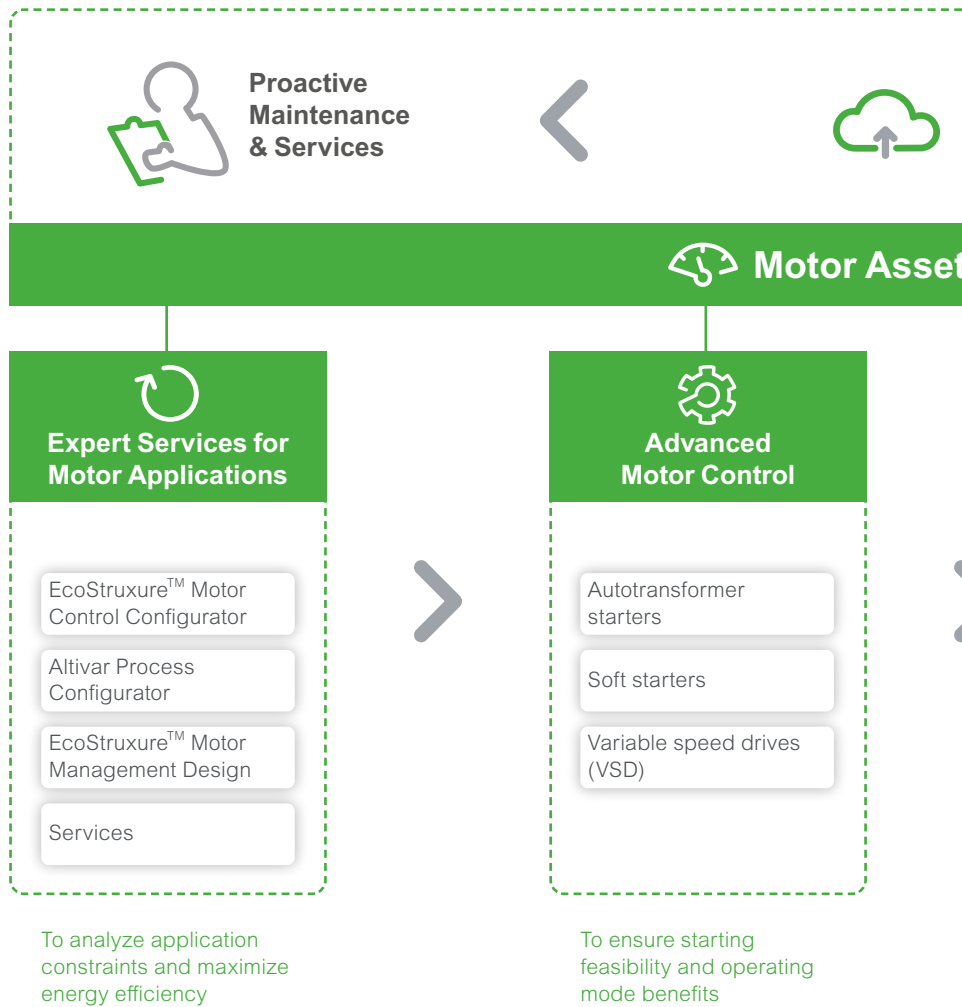

savings
thanks to the proper engineering
of Motor Management solutions.

**Improved productivity and energy
efficiency** thanks to the digital
services and analytics

Motor Management by Schneider Electric

Schneider Electric has developed a complete approach to meet the challenges you are facing. With five fundamental domains of expertise and a rich offer portfolio, we ensure the optimization of your investment and operating costs.

Every relevant parameter of your electrical system and process is considered to build the most suitable and complete solution for your motor applications.

Motor Management is crucial for industries where service continuity and process availability are key.

Water and Wastewater

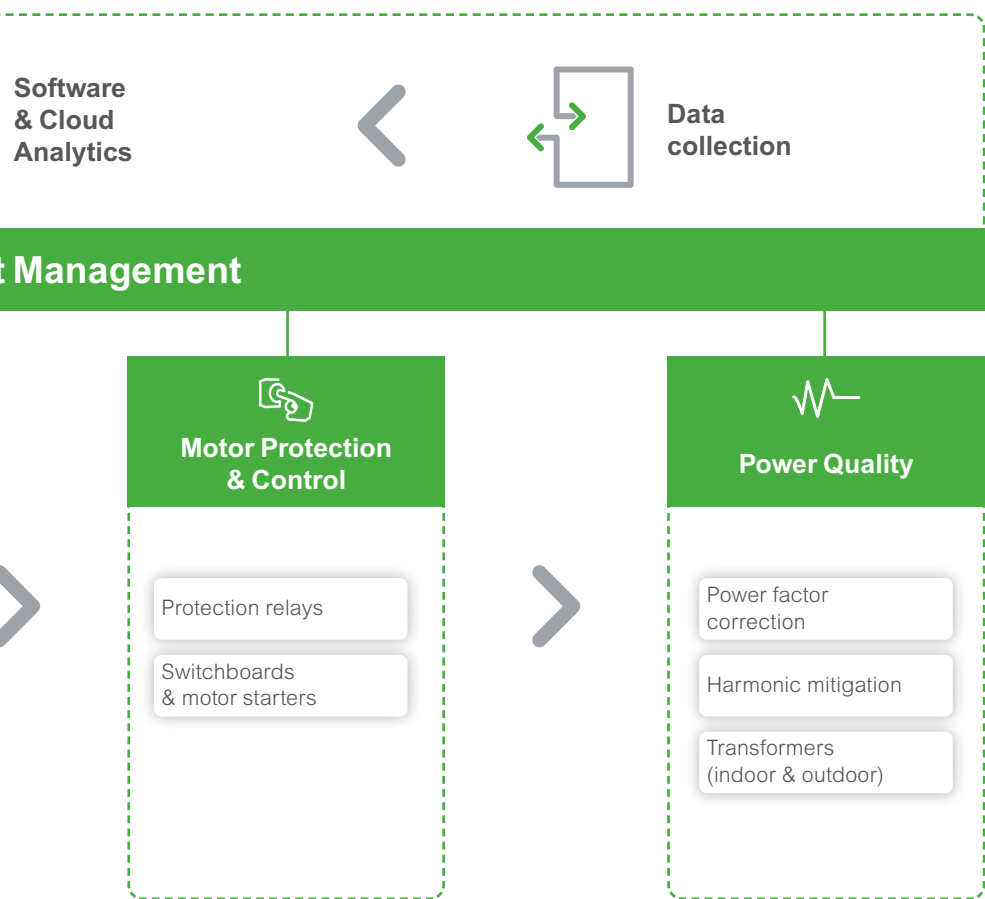

Mining, Minerals and Metals

Oil and Gas

Marine

To maximize uptime

Through condition assessment or by using historian data, motor and application failures can be avoided at an early stage. We offer an extensive range of products to help you in this approach.

More details on page 47

To define suitable protection and integration in the industrial control system

To reduce risk of installation failure

Motor Management Offer Selection Panorama

Expert Services for Motor Applications

Expertise is at the heart of the Motor Management solution. With dedicated software, relevant analyses, or services for electrical equipment, Schneider Electric supports your projects from the design phase through setup and commissioning to operation and maintenance.

EcoStruxure™ Motor Management Design	p. 12
Services	p. 14

EcoStruxure™ Motor Control Configurator

Web application to select the right combination for protection and control of your motors.

Depending on the needs of your application, the EcoStruxure™ Motor Control Configurator supports you in the selection of components to control and protect the electric motor.

3 STEPS TO BUILD YOUR COMPLETE MOTOR CONTROL SOLUTION

Purpose of the app

To select the right motor starter combination in a few clicks.

Group of users

- OEM
- Specifiers
- Panel builders
- Contractors

Key values

- Easy to use tool for motor control configuration
- Print, save, export and share your solution
- Suitable for any device:

Desktop

Tablet

Smartphone

Save time selecting the right motor starter combination

Get a complete and proven motor starter solution, including accessories

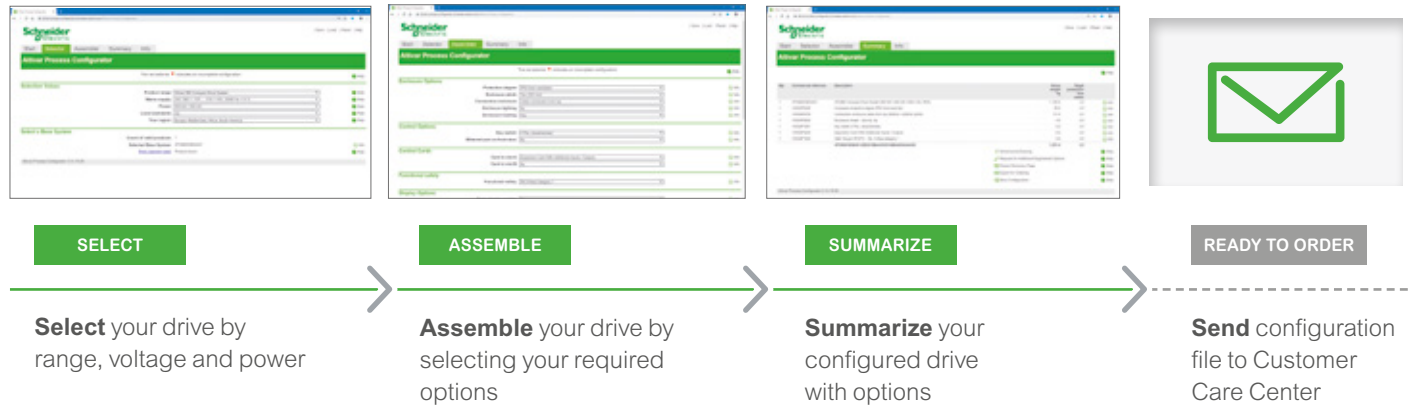

Be ready with associated product documentation accessible at the click of a button

Altivar Process Configurator

Web application for quick quotation and configuration for typical drive applications.

3 STEPS TO CONFIGURE YOUR INDIVIDUAL DRIVE

Purpose of the app

To configure and get a quotation for typical drive applications.

Group of users

- Specifiers
- Panel builders
- Contractors
- End-users

Key values

- Configure and quote your individual Drive System using the same tool
- Easily customizable Configured Drive Systems (CTO) to suit your specific requirements
- Pre-defined CTO options (e.g. enclosure plinth, cabling from top/bottom, braking unit, enclosure lighting/heating, front display module, motor heating, circuit breaker, etc.).

+ **Reduce the delivery time significantly**
for individually adapted drives, thanks to pre-defined options

+ **Quickly customize Configured Drive Systems**
to meet your requirements

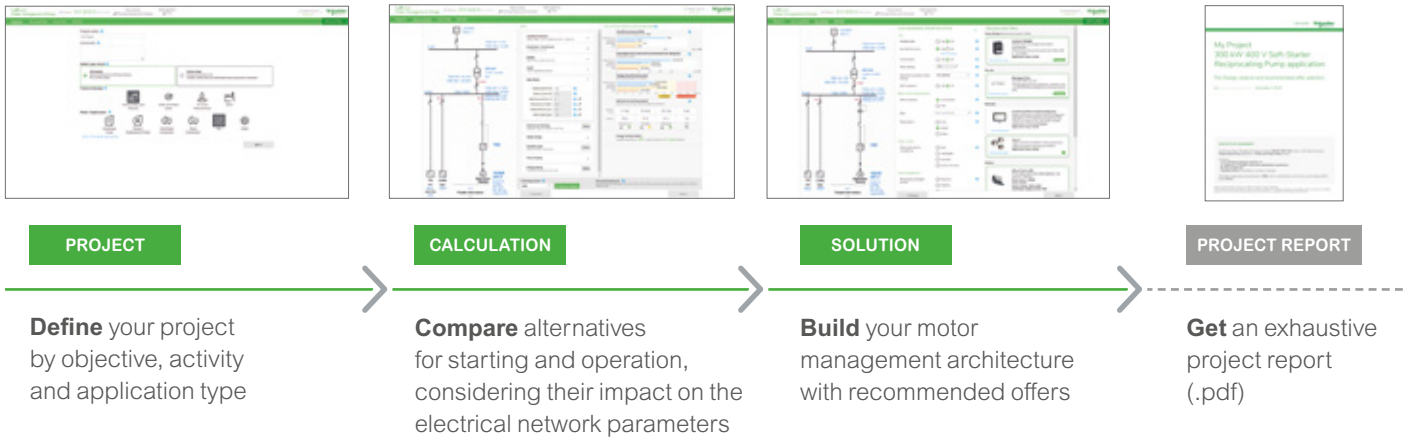

LET'S CONFIGURE YOUR DRIVE AT: [ALTIVAR-PROCESS-CONFIGURATOR.SCHNEIDER-ELECTRIC.COM](https://altivar-process-configurator.schneider-electric.com)

EcoStruxure™ Motor Management Design

Web application for quick, easy calculation and offer selection for LV and MV motor applications.

3 STEPS TO MOVE FROM PROJECT TO SOLUTION

ALL ALONG YOUR JOURNEY

Purpose of the app

To design Motor Management architectures for motor applications and help in evaluating energy efficiency for relevant applications.

Group of users

- Consultants
- Panel builders
- Contractors
- End users

Key values

- Complete motor management design approach: application, start & control, protection, power quality and asset management, energy efficiency and environmental impact.
- Easily achievable optimized and competitive designs, with limited input data
- Easy to use for newcomers and experts, with built-in help
- Management of multiple projects
- Embedded user feedback routines

Save time and gain efficiency
in electrical design when upgrading/extending with motors

Benefit from simplified offer selection procedures
to build a complete motor management architecture (from starting & control to services)

Access to the most relevant digital content
for a concrete case

LET'S START YOUR JOURNEY AT: [ECOSTRUXURE-MOTOR-MANAGEMENT.SE.APP/DESIGN](https://ecostruxure-motor-management.se.app/design)

B

Services

Assessment and Planning

Reduce risk and improve reliability

From planning a new installation to assessing the existing equipment, our consultants will help you identify potential safety and cybersecurity issues to reduce risk and improve reliability.

For Industrial Automation

Operation consulting: Our experts help optimize system investments, so you can focus on asset performance, regulatory compliance, and real-time control.

Industrial Safety Services: Our safety services help ensure your plants and equipment are well-designed, operated safely, and properly maintained.

For Electrical Distribution

MPS Consulting services: We pursue three goals - modernization, performance, and safety - that drive our decisions to help prioritize your investment.

Arc Flash assessments and analysis: We provide comprehensive arc flash analysis and information to help keep your employees and installations safe.

Installation and Commissioning

Ensure optimal performance

Install your electrical, industrial, and data center equipment according to the manufacturer's specifications to ensure optimal performance, and minimized risk of failure.

For Industrial Automation

Automation desing engineering & execution: Keep your project on time, on budget and of premier quality, with our best-in-class design, engineering and execution processes.

Drive start-up and commissioning: Optimize and protect the investment in your drive systems with drive services designed to meet your needs at every stage of the lifecycle.

Operation and Maintenance Services

On-site and remote support

Get state-of-the-art on-site maintenance and remote monitoring of your critical assets with expertise of our engineers, to keep your facility running smoothly, safely, and efficiently.

For Critical Power & Cooling

EcoStruxure Asset Advisor: Maximum protection of your critical equipment delivered with 24/7 real-time monitoring.

Monitoring and Dispatch Services: Advisors for your distributed edge infrastructure, combining 24/7 remote monitoring and on-site support.

Critical facility operations: Our dedicated staff on site will operate and maintain your data center utilizing industry best practice.

For Electrical Distribution

Electrical Distribution Service Plans: Achieve true peace of mind knowing your installation is covered by the right services plan.

Maintenance Services for Electrical Distribution: A complete solution to help maintain your equipment, ensuring service continuity.

For Industrial Automation

Automation maintenance and support: Take advantage of the numerous benefits of our maintenance and support services programs.

Operation Optimization Services: Our operator performance services help proactively meet production challenges.

Maintain and revitalize your key drive systems: Extend the life and maintain the value of your drives.

B

Safety Services

Protect your site and staff

Use our extensive knowledge of functional safety, standards, and regulatory compliance to help keep your employees and equipment safe and protected.

Safety services for Industrial Automation: Our safety services ensure that your plants and equipment are well designed, operated safely and properly maintained.

Electrical Digital Twin Service: A service offer to digitize the customer single-line diagram with ETAP software and provide ongoing model maintenance support in a recurring mode.

MPS Consulting services: The three goals behind MPS - modernization, performance, and safety, are at the heart of what we deliver to help prioritize your investments.

Arc flash assessment and analysis: With our comprehensive arc flash analysis and assessment you can keep your employees and installation safe.

Spare Parts

Get the right parts at the right time

Reduce downtime and return to full operation sooner by having spare parts available on site.

Electrical spare parts management: Access original spare parts of current and discontinued products during your equipment's full life cycle.

Automation maintenance and support: Stored locally or delivered, your critical parts are always available when you need them.

Services

Modernize

Update your aging equipment

Control the costs associated with aging equipment and improve its performance and flexibility by upgrading your electrical installations, modernizing your data center, and upgrading your automation systems.

Electrical Installation renewal

Modernize with ECOFIT: Find out how you can modernize your electrical distribution switchgear with Schneider Electric.

Upgrade or Replace: Enhance security and reduce downtime for greater peace of mind by monitoring, analyzing and optimizing your critical connected products.

Automation System Upgrade

Upgrading, Planning and Management: Successful modernization requires careful planning and management by people who understand the big picture of your operation, interconnected technologies, and who are focused on measurable business value.

DCS Migration and Upgrade: Our unique, award-winning DCS migration programs can get you to the safety, security and productivity that can come with a new DCS, often with significantly lower cost and disruption than other options.

PLC Migration and Upgrade: Improve your productivity and protect your valuable technology investment. Upgrade your PLCs to modern, state-of-the-art equipment using simple, effective, and affordable upgrade tools and quick wiring adapters.

Drives Revitalization: Extend the life and value provided by your critical drives with services to reduce the risks of failure while providing a clear path for IoT value.

B

Motor Management Offer Selection Panorama

Advanced Motor Control

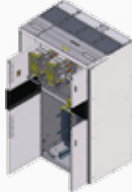

Motor starting and control of operation are fundamental to your process and definition of the Motor Management solution. Schneider Electric offers a complete range of advanced motor controls for meeting all your process constraints with regard to power system requirements.

C

Motor Management Offer Selection Panorama

Motor Protection and Control (for Asynchronous Machines)

A Motor Management solution not only provides a method for motor starting, but also includes a protection unit comprising switchgear and protection relays.

Schneider Electric offers a wide range of circuit breakers, fuses, contactors, and protection relays integrated in enclosures for protecting the motor and ensuring correct starting, while helping to ensure operator safety by means of type-tested equipment.

D

Motor Management Offer Selection Panorama

Power Quality

Choosing the correct capacitor bank, harmonic mitigation system, or transformer will ensure correct operation of the motor in the process with minimum impact on the power supply system. 30 to 40% of business downtime is caused by power quality disturbances; 60% of motor failures are due to overheating, for which poor power quality is a common cause.

Overview of EcoStruxure™ Power

Introduction

At Schneider Electric, we envision a digital-electric world with zero electrical safety incidents, zero unplanned downtime, zero energy waste and zero cyber intrusions that impact operations. We are striving to make this vision a reality with EcoStruxure™ Power, our IoT-enabled architecture and platform, that enhances productivity, reduces risks and unlocks new growth opportunities. At the core of EcoStruxure™ Power are three interwoven levels of innovation: connected products, edge control, apps, analytics and services. Continuously communicating in real-time in a cyber-secure environment, they give you complete visibility so you can optimize your network.

In a world that is increasingly digital and electric, the ways to manage business are challenged:

- Keeping staff and occupants safe is a priority that cannot be compromised
- Business Continuity is equally important, with power outages dramatically impacting profitability
- Environmentally-conscious public, customers and shareholders expect energy efficiency and sustainability initiatives
- Safeguarding intellectual property and data against cyber risks demands new level of vigilance

Motor management is part of a complete industrial installation with 3 levels:

Predictive maintenance and services, based on cloud analytics, for proactive and preventive maintenance

Process automation and supervisory systems for local asset monitoring

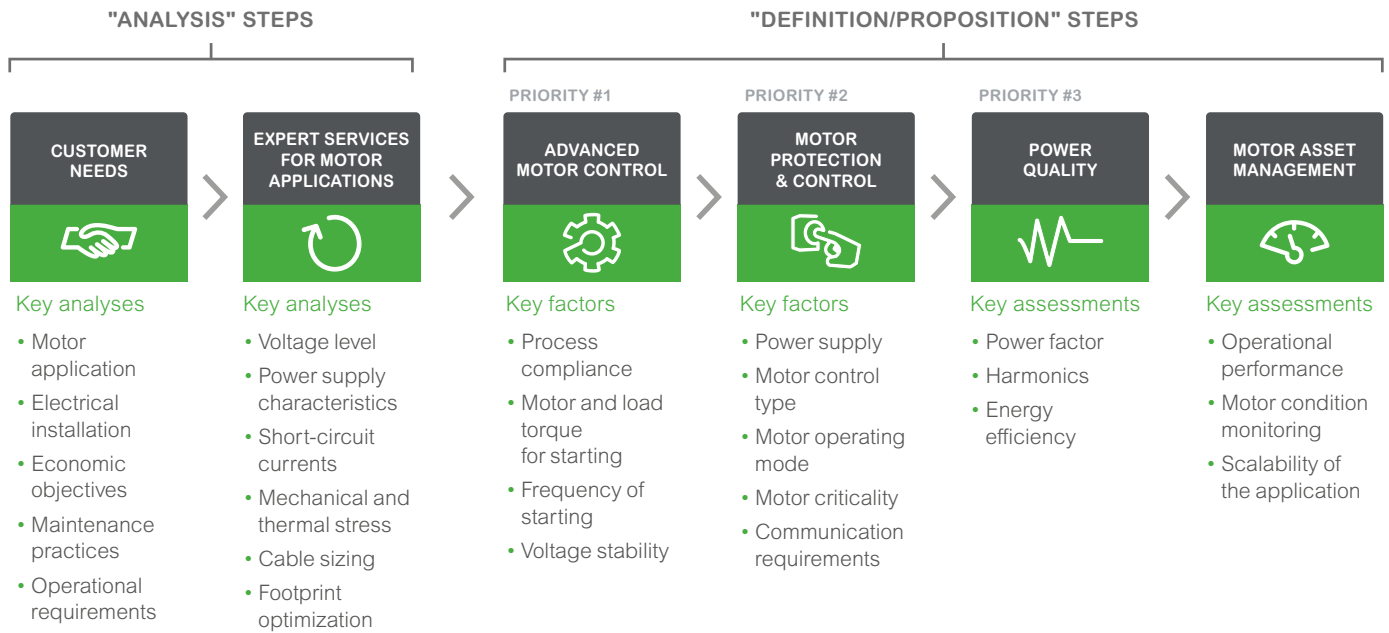

Connected Products, to make data available for analysis

- 1 Circuit breakers and fused contactors associated with protection relays are typically used to connect, protect and start motors.
- 2 Soft starters or variable speed drives are used to start and operate motors by adapting the electrical and mechanical characteristics to the load and the network.
- 3 Cables are mainly sized according to the installation requirements. Their cross-section is defined by normal and fault currents. The control mode selection can influence cable sizing and bring optimization benefits.
- 4 Motors are essentially defined by application requirements. In high power ranges, their optimization can bring overall cost savings in terms of reactive power consumption, heat losses, upstream transformers and generator sizing.
- 5 Power quality concerns extra power consumption and financial penalties from utility or equipment malfunctioning. Motors affect power quality through their control mode.

Motor Management Approach

How Can Motor Management Help Tackle the Challenges of Industries with LV and MV motors?

Electrical motor management is often associated with motor maintenance, but involves much more. It concerns multiple electrical, mechanical and maintenance challenges for end-users, designers and equipment manufacturers. With its extensive offer portfolio, competencies and know-how, Schneider Electric helps you for a sustainable motor integration in the electrical system and the industrial process.

Electrical installation

- Maintain system voltage at acceptable level during start-up
- Control power factor and harmonics in normal operation
- Limit fault current contribution and impact on equipment sizing and cost

Process and mechanics

- Define an adequate torque and speed control solution for the application
- Avoid premature aging by limiting the mechanical stress on start-up

Maintenance

- Adapt maintenance actions to the specific motor characteristics
- Properly schedule maintenance operations
- Integrate preventive maintenance in the electrical installation from the design stage

Motor Management Offer Selection Panorama

A large industrial motor, painted blue, is the central focus. It is mounted on a blue metal base and sits on a concrete foundation. To the left, there are grey pipes with green and blue markings. In the background, other industrial equipment, including a yellow component, is visible. The scene is an industrial facility.

Motor Management Glossary

This glossary explains all the technical terms and acronyms used in this Motor Management offer selection panorama.

Glossaryp. 56

2-speed Motors

Asynchronous motors can be built for 2 different speeds. This can be by means of a Dahlander arrangement, with a common point in the winding, where the ratio between the 2 speeds is always 2. Another method is to use 2 independent windings per phase, allowing any speed. In both cases one speed or the other is selected by changing the wiring of the windings. This will change the number of pole pairs.

4 Quadrants (4Q)

In motor control solutions using variable speed drives, 4-quadrant refers to the capability of the drive to reverse the power flow, for example, for cranes or downhill conveyors, where the load will temporarily transform the motor into a generator.

Advanced Control

A means of control where there is a possibility of gradual starting/stopping and/or control of the speed.

AFLR

Access Front Lateral Rear

Asset Condition Assessment

The assessment consists of providing condition status, alarm, and diagnostic information for a particular asset, motor, generator, transformer, etc.

Autotransformer

In a motor management context, an autotransformer is a power component used to transform the voltage applied to its primary side into a lower voltage, with a common connection between the primary and the secondary. It does not provide any galvanic isolation between the primary and secondary.

Autotransformer Starters

This type of motor starter uses an autotransformer in order to start a motor in 3 steps:

- The motor power is supplied through the autotransformer at a reduced voltage compared to that of the network. The starting current and torque, as well as mechanical stress, are greatly reduced compared to a DOL start.
- After a predefined time, the starting point of the autotransformer is opened, changing it into a series inductance, supplying the motor with a voltage value between the autotransformer and the network voltage. This step provides a higher current and torque allowing the motor to continue to accelerate.
- Finally, the motor is connected directly to the line for the end of starting and continuous operation.

Capacitor Banks

Power factor correction is important for the correct sizing of electrical network components (transformer, cables, etc.) and to avoid penalties on the energy bill. This correction is often achieved by connecting capacitors as a source of reactive energy. When the necessary reactive power is high and the network load is varying, it is necessary to arrange the capacitors in several banks that will be connected sequentially to provide only the required amount of compensation (automatic compensation).

Capital Expenditure (CapEx)/Operational expenditure (OpEx)

- Capital expenditure encompasses all the expenses linked to the installation of an asset.
- Operational expenditure covers all the expenses linked to the operation of an asset. It represents 90% of the total cost of a motor.

Control Systems

Device or set of devices, including software programs, used for controlling the industrial process or machines.

Cooling Types (ONAN, ONAF, OFAF, OFWF, ODWF, ODAF, AN, AF)

Mainly used for transformers, this acronym indicates the type of cooling system used. 2 letters are used to represent a single cooling method and 4 letters are used if 2 methods exist, indicating either inside or outside the tank for oil-immersed transformers or normal or boosted modes for dry-type transformers.

- The first letter indicates the nature of the fluid:
O = oil, A = air, W = water.
- The second letter indicates the type of circulation:
N = natural convection, F = forced circulation,
D = directed circulation.

Distributed Control System (DCS)

System (hardware and software) used to control the process in continuous and hybrid process industries.

Direct-On-Line (DOL)

The starting method is called direct-on-line when a motor is started by connecting it directly to the electrical network line through a contactor or circuit breaker without any other equipment in series with the stator or the rotor. This is one of the least expensive starting methods but it needs a large amount of energy from the electrical network and imposes mechanical and electrical stress on the motor.

Drive Systems

Drive systems are customized variable speed drive (VSD) solutions, fully tested and ready to connect to the electrical network and industrial process.

Energy Management and Control System (EMCS)

Energy management and control systems are used for controlling energy-consuming devices in order to minimize energy demand and consumption.

Fast Device Replacement (FDR)

The capability to replace a configured device with a new one while keeping time and effort to a minimum in order to optimize system availability. The new device boots, is configured with the same parameters as the original device, then switches to operating mode.

Harmonics/5th Harmonic

- Harmonics represent pollution or distortion in the form of the voltage and the current in industrial electrical systems. Harmonics are signals at frequencies which are multiples of the fundamental 50 or 60 Hz in industrial systems.
- The 5th harmonic is produced from the rectifier part of a 6-pulse variable speed drive. It is the highest harmonic in magnitude.

Harmonic Mitigation

Solution for reducing the harmonic content in the electrical system (typically a filtering solution).

Harmonic Voltage Factor

The harmonic voltage factor measures pollution of the voltage in the presence of harmonics (5th and above). It is used for determining derating of the motor. The HVF is typically below 2%, but for some motors it can be up to 3%.

Human Machine Interface (HMI)

Usually comprises a keypad and a (touch) display.

IAC

Internal Arc Classification.

Insulated Gate Bipolar Transistor (IGBT)

Power electronic component used in the input and output stages of variable speed drives.

LSC1/LSC2A/LSC2B(-PI/-PM)

Introduced in 2003 by the standard IEC 62271-200, it defines the loss of service continuity level of a switchboard when opening compartments (other than a busbar, in single busbar designs) as follows:

- LSC1: Other functional units or some of them can be disconnected
- LSC2A: All other functional units can be energized
- LSC2B: All other functional units and all cable compartments can be energized:
 - PI (Isolated Partition): with one or more non-metallic partitions and/or shutters
 - PM (Metallic Partition): with metallic partitions and/or shutters that are intended to be grounded

MDT Relay

Temperature electronic module used for thermal diagnosis in MV switchboards by permanently monitoring the connection temperatures and reducing maintenance costs.

Motor Control Center (MCC)/Intelligent Power & Motor Control Center (iPMCC)

A system integrating intelligent motor protection relays (iMCC) and intelligent circuit breakers (iPCC) in a functional installation system (i.e. switchboard, panel, etc.) providing connectivity to a DCS and/or SCADA through an industrial communications network.

Off-Circuit Tap Changer (Off-Load Tap Changer)

The tap changer is used to modify the transformer ratio in a limited range, such as adapting to the variation in magnitude of the supply voltage. This adaptation is made with the transformer off-load.

On-Load Tap Changer (OLTC)

A tap changer with the possibility to make the adaptation with the transformer on-load.

Power Factor Correction (PFC)

The source (generator, transformer, etc.) is designed for a rated apparent power that is the sum of the active and reactive power. The power factor is the ratio of active power over apparent power. Power factor correction consists of limiting the reactive power the source has to deliver. The reactive power is provided by another source: capacitor banks.

Programmable Logic Controller (PLC)

A device used in automation systems for controlling the industrial process or machines.

Process Control

A device or set of devices controlling the industrial process or machines.

Protection Relays

A protection relay continuously measures the electrical parameters of the equipment it protects, either directly, in low voltage, or through signal conditioners (current transformers and voltage transformers), in medium voltage. When a parameter passes a threshold set by the user, the relay issues an alarm or a trip signal. A trip signal is used to open

the circuit breaker connecting the equipment to the network. Modern digital relays also offer metering of acquired and calculated signals, diagnosis of network and equipment, communication, and control-command possibilities.

Reverse Speed

The rotation of the rotor in the opposite direction.

Root Mean Square (RMS)

This is the constant characteristic of alternating current or voltage used for calculating the power dissipation in a load.

Supervisory Control and Data Acquisition (SCADA)

Generic name for monitoring and control systems – used for energy or process control of customer installations.

Slip-ring Motors/Winding Motors

Motors with a wound rotor that can be connected to an auxiliary power supply, or to starting resistor in order to reduce the current on starting and increase the torque.

Soft starter (SS)/Reduced Voltage Soft Starter (RVSS)

Power electronics-based solution used for smoothing motor starting by controlling the current supplied to the motor, without modifying its frequency, in contrast to a variable speed drive. For low voltage applications, the usual term is soft starter (SS), whereas reduced-voltage soft starter is used for medium voltage applications.

Soft Stop

Smooth stopping of the motor, typically for soft-starter devices, by linearly reducing the supplied current. Reduces the mechanical stress on the load, very useful in pump applications.

Star-Delta

Starting method used to reduce the startup current. Needs a motor with a delta arrangement designed for the voltage network. It is first connected to the line with a wye arrangement, being equivalent to a higher voltage motor supplied by a lower voltage. After a delay, the arrangement is changed to delta to finish acceleration and for normal operation. Mainly used for low to medium power LV motors.

Switchboard and Motor Starters

A switchboard is the point at which an incoming power supply divides into separate circuits, each of which is controlled and protected by the fuses or switchgear in the switchboard. Motor starters can be integrated in the switchboard, or connected to it in standalone configuration.

Synchronous/Asynchronous Machine

In a rotating machine, there is one static part, typically called the stator, and another rotating part, called the rotor.

- In synchronous machines, the rotation speed is equal to the speed of the magnetic flux in the stator (i.e. they are synchronized) and to achieve this the rotor is also supplied with energy through a dedicated system.
- In asynchronous machines, the rotor is not supplied with power; it rotates at a speed close to but not equal to the speed of the magnetic flux, and the difference in the speeds is used to provide the energy necessary to make the rotor spin.

Total Cost of Ownership (TCO)

Refers to the cost of the initial investment and operating costs from the purchase of the equipment to its end of life.

Total Harmonic Distortion (THD/THDi)

- THD refers to the ratio of the square root of the sum of the square of the powers of all harmonic components to the power of the fundamental voltage.
- THDi is the same ratio applied to the current.

Tested, Validated, and Documented Architecture (TVDA)

TVDAs are generic solutions supplying comprehensive system documentation, wiring diagrams, HMI application, and project templates that reduce the time required for design, installation, and commissioning.

Torque Control System (TCS)

A patented principle for controlling motors using an LV soft starter, integrated in the ATS48 offer.

Transformers

In a motor management context, a transformer is a power component used to transform the voltage applied to its primary side into another voltage, providing galvanic isolation between them. It can be either step-down, where the secondary voltage is lower than the primary, or step-up, where the opposite is true.

Tripping Context

When a digital protection relay issues a trip command it can record several parameters, other than the one at the origin of the trip. These parameters, like currents, voltages, powers, and frequency, are saved together in a record. This record is called a tripping context record.

Variable Speed Drive (VSD) / Variable Frequency Drive (VFD)

- VSDs are electronic power systems used to adapt the speed of an electric motor.
- VFDs are dedicated to AC asynchronous and synchronous motors where the speed is modified by changing the applied frequency.
