Micrologic™ Trip Unit: Communication After Tripping

Communication After a Trip

This bulletin applies to communicating Micrologic™ A/E/P/H trip units for PowerPact™ P- and R-Frame circuit breaker and Masterpact™ circuit breakers.

Examples of Communicating Trip Units

The Micrologic trip unit is designed so that when it trips the circuit breaker, it also breaks communication to the Breaker Communication Module (BCM), indicating the trip.

It takes up to three seconds for the communication to be restored between the trip unit and the BCM. During this time, if there are any communication requests from the supervisory software a communication loss might be observed.

After this communication break, the trip unit automatically restores communications to the BCM.
