DB123788

Protection of electrical connections against short circuits and overloads

DB123789

Protection of loads against overloads

DB123790

Protection of control devices

DB123792

Protection for people against indirect contacts in IT and TN earthing systems

- Circuit breakers can:
 - break a faulty electrical circuit (short-circuit, overload, insulation fault), to prevent fires,
 - protect control devices,
 - increase the service life of the installation, thanks to its ability to limit the short-circuit current (see module CA908025),
 - in IT and TN systems, they ensure personal protection against electrocution in the event of indirect contacts.
- The choice of circuit breakers must be optimised to provide absolute protection while ensuring continuity of service.
- Although circuit breakers are sometimes used as control units, it is recommended to install separate control devices which are more suitable for frequent switching operations (switch, contactor, impulse relay).

Choice of protective circuit breakers

This depends on several criteria:

- prospective short-circuit current
- max. voltage rating
- planned amperage for the circuit to be protected
- nature and cross section of cables
- ambient temperature (possible derating)
- the network and neutral system, which determine the number of poles of the protective circuit breaker installed on their power supply circuit and the tripping curve
- coordination with the other electrical devices (protection, discrimination, cascading).

Choice of breaking capacity

- The breaking capacity must be greater than or equal to the prospective short-circuit current (Isc) upstream of the circuit-breaker (Isc depends on the length, type of conductor and cross section of the cable and the power of the source).
- However, in the event of use in combination with an upstream circuit-breaker limiting the current, this breaking capacity can possibly be reduced (cascading, see module 557E4200).

Choice of rating

- The rating (In) is chosen above all to protect the electrical connections:
 - for cables: it is chosen according to the cross section and type of conductor,
 - for Canalis prefabricated busbar trunking: it must be simply less than or equal to the rating of the busbar trunking.
- The rating should be greater than the nominal current of the loads.

Choice of tripping curve

The tripping curve makes the protection more or less sensitive to:

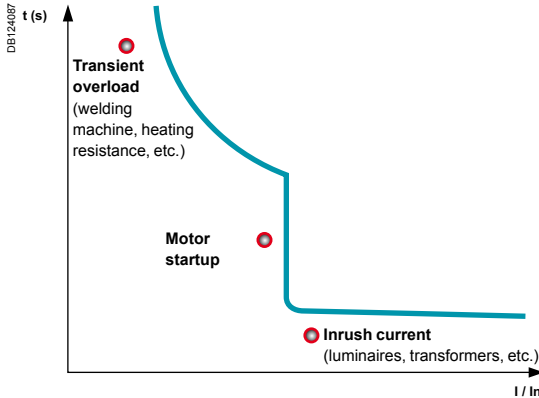

- the inrush current at power up
- the overload current.

Tripping thresholds ($\times I_n$)

Curves	IEC /EN 60898	IEC/EN 60947-2
B	Between 3 I_n and 5 I_n	4 $\pm 20\%$
C	Between 5 I_n and 10 I_n	8 $\pm 20\%$
D or K	Between 10 I_n and 14 I_n	12 $\pm 20\%$
MA	-	12 $\pm 20\%$
Z	-	3 $\pm 20\%$

- To prevent nuisance tripping, it may be advisable to choose a less sensitive curve, e.g. change from B to C (tripping curves, see module CA908024).

Continuity of service

- Nuisance tripping can be generated by:
 - the inrush current at circuit closure,
 - the overload current, and sometimes the harmonic current flowing through the neutral of three-phase circuits ⁽¹⁾,
 - motor startup currents.

Solutions

- **Choose a circuit breaker with a less sensitive curve:** change from B curve to C curve or from C curve to D curve ⁽²⁾.
- **Reduce the number of loads per circuit.**
- **Energize the circuits in succession,** using time delay auxiliaries on the control devices.
- **Under no circumstances may the circuit breaker rating be increased beyond the maximum constraints permitted by the cable as the electrical connections will no longer be protected.**

Ensure discrimination of the protective devices

(see modules **557E4300**).

Discrimination is the coordination of automatic breaking devices in such a way that a fault occurring at any point on the network is eliminated by the circuit breaker located immediately upstream of the fault, and by it alone.

Total discrimination

For all values of the fault, from overload to non-resistive short circuit, distribution is fully discriminating if D2 opens and if D1 remains closed.

Partial discrimination

Discrimination is partial if the above condition is not complied with up to full short-circuit current, but only up to a lower value. This value is called the discrimination limit.

In the event of a fault exceeding this value, circuit breakers D1 and D2 open.

(1) In the case of three-phase circuits, third-order harmonic currents and harmonic currents that are multiples of three are generated by loads (discharge lamps with electronic ballast, etc.). The neutral cable must be sized to prevent it from overheating. The current flowing through the neutral conductor may become greater than the current of each phase and cause nuisance tripping.

(2) In the case of installations with very long cables in a TN or IT system, it may be necessary to add an earth leakage protection device to protect human life..

Circuit disconnection

Disconnection

The purpose of disconnection is to separate and isolate a circuit or a device from the rest of the electrical installation in order to ensure the safety of personnel having to work on the electrical installation for maintenance or repair.

- The circuit breaking must be omnipolar, i.e. the live conductors, including neutral ⁽³⁾, must be cut off (depending on country regulations).
- It must be lockable or padlockable in "open" position in order to prevent any unintentional reclosing, at least in industrial environments.
- It must be in compliance with a standard ensuring its suitability for isolation.

(3) With the exception of the PEN conductor which should never be cut off.

The Schneider Electric circuit breaker range comprises various offers (Clario, Prodis, Libro) so as to be as competitive as possible in each country, taking into account the specific features of each market:

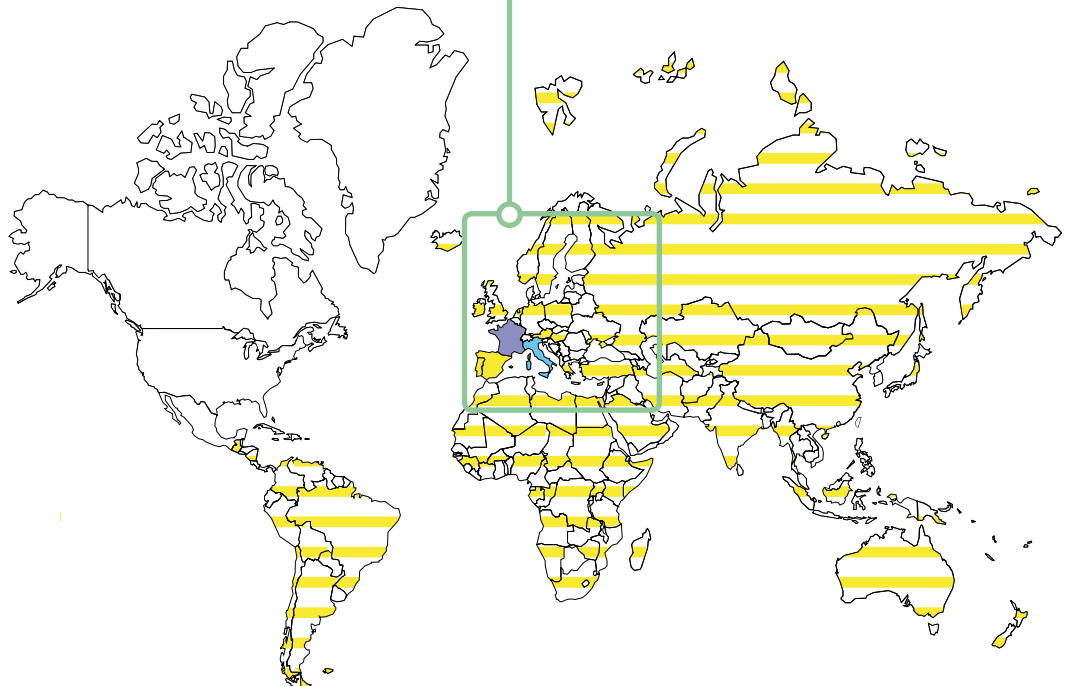

- installation customs
- price
- approval by local organizations.

Variants

Offers		Pages
Clario	Catalogue numbers	15
Prodis	Catalogue numbers	19
Libro	Catalogue numbers	23
Common pages		26

Only the product range to be marketed in your country and validated by the local product manager, in agreement with his Final Distribution (FD) partner should be retained. The others will be removed before publication.

Country approval pictogram

IEC/EN 60898-1

- i DPN are circuit breakers which combine the following functions:
 - circuit protection against short-circuit currents,
 - circuit protection against overload currents,
 - suitable for isolation according to IEC/EN 60898-1 standard.

iC60a circuit breakers (curve C) (cont.)

PB104433-40

- Increased product service life thanks to:
 - overvoltage resistance by high level of industrial performances conception (pollution degree, rated impulse withstand voltage and insulation voltage),
 - high performance limitation (see limitation curves),
 - fast closing independent of the speed of actuation of the toggle.
- Remote indication, open/closed/tripped, by optional auxiliary contacts.
- Top or bottom electrical feeding.

1P	125
2P	250
3P	375
4P	500

Dimensions (mm)

Schneider Electric's range of circuit breakers consists of different products (A, B, C) to enable it to be the most competitive range possible in each country, allowing for the special characteristics of each market:

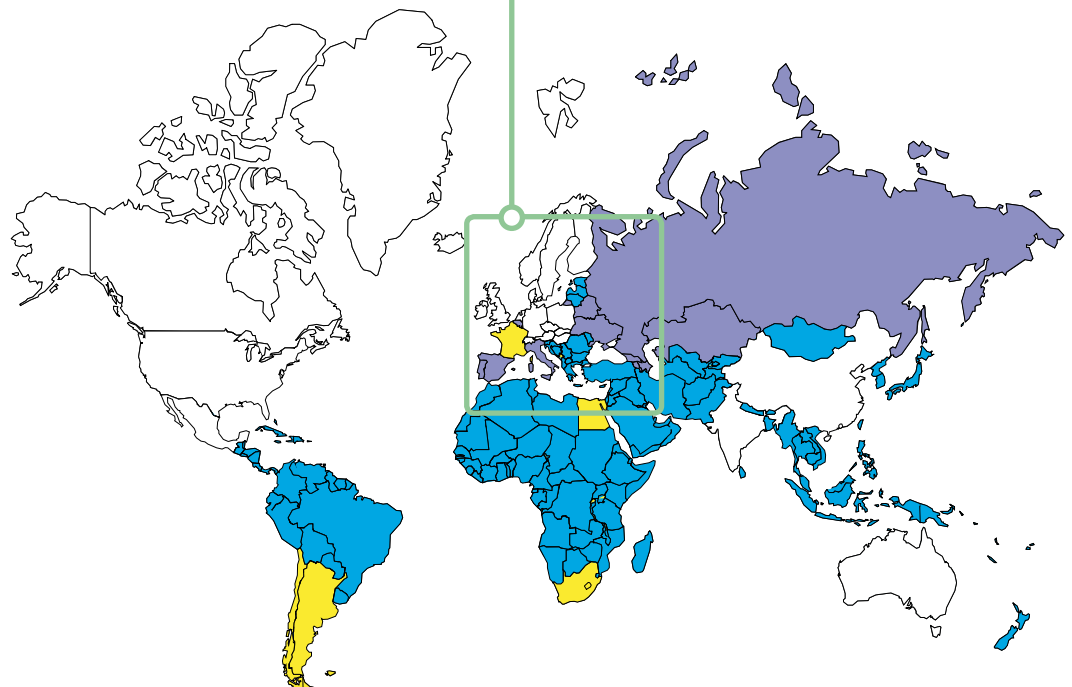

- usual installation procedure
- price
- accreditations by local bodies.

Variants

Offers		Pages
Offer A	Catalogue numbers	34
Offer B	Catalogue numbers	36

Only the product range to be marketed in your country and validated by the local product manager, in agreement with his Final Distribution (FD) partner should be retained. The others will be removed before publication.

iC60N circuit breakers (curve B, C, D)

IEC/EN 60947-2 IEC/EN 60898-1

- iC60N circuit breakers are multi-standard circuit breakers which combine the following functions:
 - circuit protection against short-circuit currents,
 - circuit protection against overload currents,
 - suitable for industrial isolation according to IEC/EN 60947-2, standard.
 - fault tripping indication by a red mechanical indicator in circuit breaker front face.

iC60N circuit breakers (curve B, C, D)

IEC/EN 60947-2 IEC/EN 60898-1

- iC60N circuit breakers are multi-standard circuit breakers which combine the following functions:
 - circuit protection against short-circuit currents,
 - circuit protection against overload currents,
 - suitable for industrial isolation according to IEC/EN 60947-2, standard.
 - fault tripping indication by a red mechanical indicator in circuit breaker front face.

iC60N circuit breakers (curve B, C, D) (cont.)

PB10434-40

- Increased product service life thanks to:
 - overvoltage resistance by high level of industrial performances conception (pollution degree, rated impulse withstand voltage and insulation voltage),
 - high performance limitation (see limitation curves),
 - fast closing independent of the speed of actuation of the toggle.
- Remote indication, open/closed/tripped, by optional auxiliary contacts.
- Top or bottom electrical feeding.

Technical data

Main characteristics		
According to IEC/EN 60947-2		
Insulation voltage (U _i)		500 V AC
Pollution degree		3
Rated impulse withstand voltage (U _{imp})		6 kV
Thermal tripping	Reference temperature	50°C
	Temperature derating	See module CA908007
Magnetic tripping	B curve	4 I _n ± 20 %
	C curve	8 I _n ± 20 %
	D curve	12 I _n ± 20 %
Utilization category		A
According to IEC/EN 60898-1		
Limitation class		3
Rated making and breaking capacity of an individual pole (I _{cn1})		I _{cn1} = I _{cn}
Additional characteristics		
Degree of protection (IEC 60529)	Device only	IP20
	Device in modular enclosure	IP40 Insulation class II
Endurance (O-C)	Electrical	10,000 cycles
	Mechanical	20,000 cycles
Overvoltage category (IEC 60364)		IV
Operating temperature		-35°C to +70°C
Storage temperature		-40°C to +85°C
Tropicalization (IEC 60068-1)		Treatment 2 (relative humidity 95 % to 55°C)

Disassembly double terminals iC60 circuit breaker with the comb busbar in position

- 1- Pull lower "clip locking"
- 2- Pull upper "clip locking"
- 3- Remove the circuit breaker

Schneider Electric's range of circuit breakers consists of different products (A, B, C) to enable it to be the most competitive range possible in each country, allowing for the special characteristics of each market:

- usual installation procedure
- price
- accreditations by local bodies.

Variants

Offers		Pages

iC60H circuit breakers (curve B, C, D) (cont.)

PB104495-40

- Increased product service life thanks to:
 - overvoltage resistance by high level of industrial performances conception (pollution degree, rated impulse withstand voltage and insulation voltage),
 - high performance limitation (see limitation curves),
 - fast closing independent of the speed of actuation of the toggle.
- Remote indication, open/closed/tripped, by optional auxiliary contacts.
- Top or bottom electrical feeding.

iC60H double terminals circuit breakers (curve B, C, D) (cont.)

Insulated terminals IP20

Double terminals
 ■ For top or bottom connections:
 □ by cable,
 □ by comb busbar

Large circuit labelling area

Visi-trip window
 ■ Fault tripping is indicated by a red mechanical indicator on the front face

Double clip locking allowing tool-free removal, front panel side, with the comb busbar in position

Positive contact indication
 ■ Suitable for industrial isolation according to IEC/EN 60947-2 standard
 ■ The presence of the green strip guarantees physical opening of the contacts and allows operations to be performed on the downstream circuit in complete safety

1 Pull
2 Pull
3 Pull

- Increased product service life thanks to:
 - overvoltage resistance by high level of industrial performances conception (pollution degree, rated impulse withstand voltage and insulation voltage),
 - high performance limitation (see limitation curves),
 - fast closing independent of the speed of actuation of the toggle.
- Remote indication, open/closed/tripped, by optional auxiliary contacts.
- Top or bottom electrical feeding.

Technical data

Main characteristics

According to IEC/EN 60898-1

Insulation voltage (Ui)		440 V AC
Pollution degree		2
Rated impulse withstand voltage (Uimp)		4 kV
Thermal tripping	Reference temperature	30°C
	Temperature derating	See module CA908007
Magnetic tripping	B curve	3 to 5 In
Limitation class		3
Rated making and breaking capacity of an individual pole (Icn1)		Icn1 = Icn

Additional characteristics

Degree of protection (IEC 60529)	Device in modular enclosure	IP40 Insulation class II
Endurance (O-C)	Electrical	10,000 cycles
	Mechanical	20,000 cycles
Overvoltage category (IEC 60364)		III
Operating temperature		-25°C to +60°C
Storage temperature		-40°C to +85°C

Weight (g)

Circuit-breaker

Type	iK60N
1P	100
2P	200
3P	300
4P	400

Dimensions (mm)

Schneider Electric's range of circuit breakers consists of different products (A, B, C) to enable it to be the most competitive range possible in each country, allowing for the special characteristics of each market:

- usual installation procedure
- price
- accreditations by local bodies.

Variants

Offers		Pages
Offer A	Catalogue numbers	67
Offer B	Catalogue numbers	68
Offer C	Catalogue numbers	69

IEC/EN 60898-1

- K60H Biconnect circuit breakers are circuit breakers which combine the following functions:
 - circuit protection against short-circuit currents,
 - circuit protection against overload currents,
 - disconnection, opening and closing.

K60H Biconnect circuit breaker 50/60 Hz		
Breaking capacity in short circuit (I_{cn}) as per IEC/EN 60898-1		Service breaking capacity (I_{cs}) 75 % of I _{cn}
Ph/Ph	400 V	
Ph/N	230 V	
Rating (I_n)	6 to 63 A	10000 A

■ Location for 4 clip-on terminal markers

Positive contact indication

- Suitability for isolation in the industrial sector to IEC/EN 60947-2.
- The presence of the green strip guarantees that the contacts open physically and allows work to be carried out safely on the downstream circuit.

- Longer product service life thanks to:
 - good overvoltage withstand capacity: products designed to offer a high industrial performance level (degree of pollution, rated impulse withstand voltage and insulation voltage).
 - high limitation performances (see limitation curves).
 - fast closure independent of toggle operating speed.
- Remote indication of the open/closed/tripped state by auxiliary contacts (optional).
- Power supply from above or below.

NG125a circuit breakers (curve C)

IEC/EN 60947-2

■ NG125a circuit breakers are circuit breakers which combine the following functions:

- circuit protection against short-circuit currents,
- circuit protection against overload currents,
- suitability for isolation in the industrial sector to IEC/EN 60947-2,
- tripping upon fault is indicated by a red mechanical state indicator light on the front face of the circuit breaker.

DB122493

- Voltage taps:
 - auxiliaries power supply
 - measurement
 - emergency stop
 - remote reporting

- Cable strength:
 - ribbed cage
 - terminal depth
 - tightening by Allen hex key

- Integrated padlocking device

- Test button to check satisfactory operation of the tripping mechanism

- Pull-out strength:
 - metallic lock

- Impact and vibration resistance:
 - high-strength enclosure
 - IK 05

- Central manual control, 3 positions:
 - ON
 - tripped on fault
 - open

- Circuit breaker tripped indicator

- Electric power supply through the top or bottom

- Positive contact indication:
 - suitability for isolation in the industrial sector to IEC/EN 60947-2
 - the presence of the green strip guarantees that the contacts open physically and allows work to be carried out safely on the downstream circuit

- Longer product service life due to:
 - good overvoltage withstand capacity,
 - high limitation performances,
 - fast closure independent of the speed of actuation of the toggle.

The Schneider Electric circuit breaker range comprises various offers (A, B) so as to be as competitive as possible in each country, taking into account the specific features of each market:

- Installation customs
- Price
- Approval by local organizations.

NG125L circuit breakers (curves B, C, D)

IEC/EN 60947-2

- NG125L circuit breakers are circuit breakers which combine the following functions:
 - circuit protection against short-circuit currents;
 - circuit protection against overload currents;
 - suitability for isolation in the industrial sector to IEC/EN 60947-2;
 - tripping upon fault is indicated by a red mechanical state indicator light on the front face of the circuit breaker.

Technical data

- Tripping curves: C curve - Overcurrent protection for any type of application.
- Positive break indication - the green strip indicates that all the poles are open and allows work to be carried out on the downstream circuit in complete safety.
- Suitable for isolation as defined in IEC 60947-2.
- Increase in the service life of the product: thanks to fast closure independent of the speed of action on the handle.
- Current limitation in the event of a fault: fast opening of the contacts prevents the loads from being destroyed in the event of a short-circuit.

Main characteristics

According to IEC 60947-2

Insulation voltage (Ui)		500 V DC
Rated voltage (Un)	1P	250 V DC
	2P	500 V DC
Operating voltage (Ue)	1P	24...250 V DC
	2P	24...500 V DC
Pollution degree		3
Rated impulse withstand voltage (Uimp) under frame		6 kV
Magnetic tripping (Ii)		8.5 In (± 20 %) (compatible with curve C)

Additional characteristics

Degree of protection (IEC 60529)	Device in modular enclosure	IP40
Utilization category		A (no delay in accordance with IEC 60947-2 standards)
Endurance (O-C)	Electrical	3,000 cycles (where L/R=2 ms) 6,000 cycles where the circuit is resistive
	Mechanical	20,000 cycles
Tropicalization (IEC 60068-2)		Treatment 2 (relative humidity 95 % at 55°C)
Operating temperature		-25°C to 70°C
Storage temperature		-40°C to 85°C

Failure to match polarity during connection may lead to a fire hazard and/or serious injury.

- The connection polarity must be observed (marked on the front panel).
- Use only with direct current.

Details of minimum distance between circuit-breaker and earthed metal parts for circuit-breaker intended for use without enclosure.

PB109403-50

The C60PV-DC is a DC circuit breaker dedicated to multi string photovoltaic installations.

This circuit breaker is designed to protect the cables located between each string of photovoltaic modules and the photovoltaic inverter against overloads and short circuits (see application diagram).

Combined with a switch (of the C60NA-DC type, for example), the C60PV-DC will be installed in a string PV protection enclosure at the end of each string of photovoltaic modules.

It can be locked (by a padlocking device) in OFF position as a safety measure for removal of the PV inverter.

Since a fault current can flow in the reverse direction to the operating current, the C60PV-DC can detect and protect against any bidirectional current.

To ensure the safety of the installation, it is necessary, depending on the various types of application, to combine the C60PV-DC with:

- a residual current device at the AC end,
- a fault passage detector (insulation monitoring device) at the DC end
- an earth protection circuit breaker at the DC end (see Practical Advice CA908035).

In all cases, fast action on site will be required to clear the fault (protection not ensured in the event of a double fault).

C60PV-DC is not polarity sensitive: (+) and (-) wires can be inverted without any risk.

The C60PV-DC is delivered with three inter-pole barriers to provide increased isolation distance between two adjacent connectors.

IEC / EN 60947-2

DB404840

Main characteristics

Operating voltage (Ue)	800 V DC
Rated insulation voltage (Ui)	1,000 V DC
Breaking capacity (Icu)	1.5 kA
Impulse voltage (Uimp)	6 kV

50 A/700 V DC

Technical data

- Position contact indication - suitability for isolation according to IEC/EN 60947-2 standard.
- The presence of the green strip guarantees physical opening of the contacts and allows operations to be performed on the downstream circuit in complete safety.
- Increased product service life thanks to fast closing independent of the speed of actuation of the toggle.
- Pre-wired product: Input / Output on the same side.

PB109404-50

The C60NA-DC is a direct current switch-disconnector dedicated to disconnection of the string of photovoltaic modules and the PV inverter.

It is designed to isolate the string of photovoltaic modules and the inverter from the rest of the photovoltaic installation for maintenance operations in complete safety.

Combined with a circuit breaker (of the C60PV-DC type, for example), the C60NA-DC will be installed in a string PV protection enclosure close to the strings of photovoltaic modules. It can also be installed near the PV inverter.

It can be locked (by a padlocking device) in OFF position to ensure safety during maintenance operations.

Since a fault current can flow in the reverse direction to the normal operating current, the C60NA-DC can switch a multi-directional current.

C60NA-DC is not polarity sensitive: (+) and (-) wires can be inverted without any risk.

The C60NA-DC is delivered with three inter-pole barriers to provide increased isolation distance between two adjacent connectors.

Choice of motor supply cable cross-section

- The motor starting current and permissible voltage drop must be taken into account when choosing the cross-section.
- The cable must accept a current at least equal, when used continuously, to the sum of $I_n + I_d/3$ where:
 - I_n : rated current,
 - I_d : starting current (4 to 8 I_n), depending on the motors.

Voltage drop

- The voltage drop permitted between the source and the motor concerned is 5% for public distribution networks and 8% for subscriber or transformer substations.
- If the torque of the machine to be driven is low at startup, simply check the voltage drop for the rated current of the motor.
- If the startup torque is high (grain crushers, goods lift, etc.), check the voltage drop for the starting current.

Protection of the motor supply line

- All circuits and motors must be protected against overloads and short-circuits.

Connecting the circuit breaker for use with a single-phase motor

- Two circuit breaker poles must be connected in series.

Technical data

Main characteristics

According to IEC/EN 60947-2

Insulation voltage (U _i)	690 V AC	
Degree of pollution	3	
Rated impulse withstand voltage (U _{imp})	8 kV	
Thermal tripping	Reference temperature	40°C
Magnetic tripping (I _n)	MA curve	12 I _n ± 20 %
Utilization category		A

Additional characteristics

Degree of protection (IEC 60529)	Device only	IP20
	Device in modular enclosure	IP40
Endurance (O-C)	Electrical	10,000 cycles
	Mechanical	20,000 cycles
Operating temperature		-30°C to +70°C
Storage temperature		-40°C to +70°C
Tropicalization (IEC 60068-1)		Treatment 2 (relative humidity of 95 % at 55°C)

NG125LMA circuit breakers (curve MA) (cont.)

095918N_SE-90

DB123483

3P 80 A
 ■ Voltage taps:
 auxiliaries power supply
 measurement
 emergency stop
 remote reporting

■ Cable strength:
 ribbed cage
 terminal depth
 tightening by Allen hex key (NG125 80 A)

■ Padlocking in position:
 O or I, manual control is inhibited, tripping is enabled

■ Test button to check satisfactory operation of the tripping mechanism

3P
 ■ Pull-out strength:
 metallic lock

3P
 ■ Integrated padlocking device

■ Impact and vibration resistance:
 high-strength enclosure
 IK 05

■ Central manual control, 3 positions:
 ON
 tripped on fault
 open

■ Circuit breaker tripped indicator

■ Positive contact indication:
 suitability for isolation in the industrial sector to IEC/EN 60947-2
 the presence of the green strip guarantees that the contacts open physically and allows work to be carried out safely on the downstream circuit

■ Longer product service life due to:
 good overvoltage withstand capacity,
 high limitation performances,
 fast closure independent of the speed of actuation of the toggle.

STI	Cartridges
IEC EN 60947-3	NF C 60-200, NF C 63-210 and IEC 60269-1/2

- The STI isolatable fuse-carriers provide overload and short-circuit protection.
 - They are used for industrial applications requiring a high breaking capacity.
 - They perform the isolation function and must not be used as switches.
 - They can be equipped with an indicator light indicating blowing of the fuse cartridge.
 - Isolation of all poles is guaranteed for the 2P, 3P, and 3P+N versions during factory assembly.
- The general purpose fuse (gG fuse) provides overload and short-circuit protection. The fuse for motor application (**aM fuse**) only provides short-circuit protection. It is used for protection of loads with a high peak current (motors, transformer primaries, etc.).

Accessories

Comb busbar

- Used to quickly bridge several STI of the same kind.

Busbar connectors

- Used to supply the busbar.
- For 25 mm² cable.

230 V neon indicator light

- Indicates fuse blowing (off in normal operation and lit red after fuse blowing).
- 400 V maxi.

Padlocking device

- Locks the toggle in the "open" or "closed" position. Used with an 8 mm max. diameter padlock (not supplied).

Clip-on markers (C60 type)

- Used to identify:
 - either on the front face of the device
 - or on the downstream terminals.

- The plug-in fuse switches disconnectors D01 and the switches disconnectors fuse D02 provide protection against overloads and short circuits.
- They are used for service sector and industrial applications.
- Depending on the versions, they should be provided with D01 or D02 type cartridges.

Accessories

- The D02 gauges allow you to limit the rating of the fuses, depending on the model used, from 20 A to 50 A.

Choice of sensitivity

The sensitivity of an earth leakage protection device depends mainly on the function it has to perform:

- Protection from electric shock by direct contact.
- Protection from electric shock by indirect contact.
- Protection from fire due to current leakage.

The following table gives a reminder of:

- The circuits that must be protected against these various risks (obligation or recommendation).
- The type of earth leakage protection device to be used in each case, its sensitivity, and its location in the distribution diagram.

Type of protection	Obligations		Recommended by Schneider Electric	Sensitivity (I Δ n)		
	National standard <i>To be filled in according to the country standard</i>	International standard IEC 60364		30 mA (*)	100 mA to 3000 mA (depending on the earthing system)	300 mA (or 500 mA)
Protection from electric shock by direct contact						
 <small>DB123167</small>	<i>To be filled in according to the country standard</i>	Power supply for <ul style="list-style-type: none"> ■ General-purpose power sockets, up to 20 A ■ Appliances in the vicinity of a bathtub, shower, pond or swimming pool ■ Portable appliances for outdoor use, up to 32 A ■ Lighting for exhibition stands and shows ■ Outdoor lighting <i>To be modified according to national obligations (above)</i>	<ul style="list-style-type: none"> ■ Lighting in the home 	Setup in final distribution switchboard <ul style="list-style-type: none"> ■ Residual current device protecting a circuit ■ Residual current circuit breaker protecting a group of circuits 		
Protection from electric shock by indirect contact						
 <small>DB123168</small>	<i>To be filled in according to the country standard</i>	The entire power distribution system, except for devices: <ul style="list-style-type: none"> ■ With class II insulation ■ Operating at Safety Extra Low Voltage (class III) <i>To be modified according to national obligations (above)</i>	—	Setup in final distribution switchboard <ul style="list-style-type: none"> ■ Residual current circuit breaker or device, on incoming feeder Setup in subdistribution board or main switchboard <ul style="list-style-type: none"> ■ Residual current device protecting a circuit ■ Residual current device or circuit breaker protecting a group of circuits ■ On incoming feeder: residual current circuit breaker or device 		
Protection from fire due to current leakage						
 <small>DB123169</small>	<i>To be filled in according to the country standard</i>	<ul style="list-style-type: none"> ■ High-risk premises: <ul style="list-style-type: none"> □ explosion (BE3) □ fire (BE2) ■ Agricultural and horticultural buildings ■ Equipment for fairs, exhibitions and shows ■ Temporary outdoor recreational installations <i>To be modified according to national obligations (above)</i>	<ul style="list-style-type: none"> ■ Dilapidated buildings or electrical installations ■ Humid atmospheres: agricultural buildings, public swimming pools ■ Presence of chemical agents 			Setup in final distribution switchboard <ul style="list-style-type: none"> ■ Residual current circuit breaker or device, on incoming feeder Setup in subdistribution board or main switchboard <ul style="list-style-type: none"> ■ Residual current device protecting each circuit to a high-risk zone ■ Residual current device or circuit breaker protecting a group of circuits ■ On incoming feeder: residual current circuit breaker or device

(*) The 10 mA sensitivity is useful for certain very specific applications, where there is a risk that someone could sustain a non-dangerous current (10 to 30 mA) without being able to get free. Example: healthcare equipment for hospital beds. Generally, devices with this very high sensitivity are liable to cause frequent tripping, due to the natural leakage currents of the installation.

Interference immunity

Schneider Electric provides various equipment technologies capable of overcoming the consequences of interference of all kinds.

Operating conditions		Examples	Types				
			AC	A	SI	B

(1) SiE for C120 and NG125 circuit-breakers

Discrimination

Residual current devices of average sensitivity (100 mA and more) are available in a selective (S) and delayed (R) version. This option ensures that, in the event of an earth fault downstream of the installation, only the defective part is switched off. The table below shows (in green) which upstream/downstream equipment combinations provide this discrimination.

Sensitivity (mA) - Downstream		Sensitivity (mA) - Upstream												
		Instantaneous						Selective S			Delayed R			
		30	100	300	500	1000	3000	100	300	500	1000	3000	1000	3000

I_{nc}: rated conditional short-circuit current

Value of the alternating component of the prospective current that a residual current circuit breaker protected by an appropriate short-circuit protective device (SCPD) mounted in series can withstand in specified conditions of use.

I_{Δc}: rated residual short-circuit current

Value of the alternating component of the prospective residual current that a residual current circuit breaker protected by an appropriate short-circuit protective device (SCPD) mounted in series can withstand in specified conditions of use.

I_m: rated making and breaking capacity

Value of the alternating component of the prospective current that a residual current circuit breaker is capable of establishing or interrupting in specified conditions of use.

I_{Δm}: rated making and breaking capacity

Value of the alternating component of the prospective residual current that a residual current circuit breaker is capable of establishing and withstanding during its opening time and interrupting in specified conditions of use and behaviour.

SCPD

Short-circuit protective device (a fuse in the case of our markings): this is the max. fuse that can be used to resist the value $I_{nc} = I_{Δc}$.

Schneider Electric's range of residual current circuit breakers consists of different products (A, B, C, D) to enable it to be the most competitive range possible in each country, allowing for the special characteristics of each market:

- usual installation procedure
- price
- accreditations by local bodies.

Variants

Offers		Pages
Offer A	Catalogue numbers	160
Offer B	Catalogue numbers	163
Offer C	Catalogue numbers	166
Offer D	Catalogue numbers	169
Common pages		172

Only the product range to be marketed in your country and validated by the local product manager, in agreement with his Final Distribution (FD) partner should be retained. The others will be removed before publication.

IEC/EN 61008-1

- The iID residual current circuit breakers provide:
 - protection of persons against electric shock by direct contact (≤ 30 mA),
 - protection of persons against electric shock by indirect contact (≥ 100 mA),
 - protection of installations against the risk of fire (300 mA or 500 mA).

Offer C

This sticker must be removed before publishing

IEC/EN 61008-1

- The iID residual current circuit breakers provide:
 - protection of persons against electric shock by direct contact (≤ 30 mA),
 - protection of persons against electric shock by indirect contact (≥ 300 mA),
 - protection of installations against the risk of fire (300 mA or 500 mA).

The **SI** type provides increased immunity from electrical interference and polluted or corrosive environments.

Technical data

Main characteristics

Insulation voltage (U _i)	500 V
Pollution degree	3
Rated impulse withstand voltage (U _{imp})	6 kV

According to IEC/EN 61008-1

Making and breaking capacity (I _m /I _{Δm})	1500 A	
Surge current withstand (8/20 μs) without tripping	AC and A types (no selective)	250 A
	AC, A types (selective)	3 kA
	SI type	3 kA
Conditional rated short circuit current (I _{nc} /I _{Δc})	With iC60N/H/L	Equal to breaking capacity of iC60
	With fuse	10,000 A
Behaviour in case of voltage drop		Residual current protection down to 0 V according to IEC/EN 61008-1 § 3.3.4

Additional characteristics

Degree of protection	Device only	IP20
	Device in modular enclosure	IP40
Endurance (O-C)	Electrical (AC1) 16 to 63 A	15,000 cycles
		80 to 100 A
	Mechanical	20,000 cycles
Operating temperature	AC type	-5°C to +60°C
	A and SI types	-25°C to +60°C
Storage temperature		-40°C to +85°C

Weight (g)

2P	210
4P	370

iLD double terminals residual current circuit breakers (AC, A, SI types) (cont.)

PB107414-40

PB107413-60

SI type

The SI type provides increased immunity from electrical interference and polluted or corrosive environments.

Schneider Electric's range of residual current circuit breakers consists of different products (A, B, C, D) to enable it to be the most competitive range possible in each country, allowing for the special characteristics of each market:

- usual installation procedure
- price
- accreditations by local bodies.

IEC/EN 61008-1

Adapted to the needs of service sector and industrial building installations, residual current circuit breakers ensure:

- earth leakage protection of final distribution circuits.
- disconnection.

In accordance with the IEC 61008 standard for residual current devices, a residual current circuit breaker also performs the function of disconnection of electrical circuits.

Residual current circuit breakers include in their enclosure the residual current relay and the toroid. The residual current tripping device is electromechanical and operates without an auxiliary source.

Operation

- When an earth fault occurs, the residual current circuit breaker uses the energy of the fault to perform tripping. Fault indication is performed on the front panel by a mechanical indicator.
- Resetting is performed using the reset handle.

Type

1P+N	205
------	-----

RCCB-ID 125 A residual current circuit breaker (AC, A, SI types)

IEC/EN 61008-1
VDE 0664

- The RCCB-ID 125 A residual current circuit breakers provide:
 - protection of persons against electric shock by direct contact (30 mA),
 - protection of persons against electric shock by indirect contact (≥ 100 mA),
 - protection of installations against the risk of fire (300 mA or 500 mA).

The **SI** type provides increased immunity from electrical interference and polluted or corrosive environments.

OFsp auxiliary

- Electrical indication: by OFsp auxiliary mounted to the left, it has a double changeover switch indicating the "open" or "closed" position of the RCCB-ID 125 A.

Accessories

- 2P and 4P sealable screw shield.

 - protection of persons against electric shock by direct contact (30 mA),
 - protection of persons against electric shock by indirect contact (≥ 300 mA),
 - protection of installations against the risk of fire (300 mA or 500 mA).

B type

The RCCB-ID B type residual current circuit breakers provide:

- protection in the event of a continuous fault current on three-phase networks generated by:
 - controllers and variable speed drives,
 - battery chargers and inverters,
 - backed-up power supplies.

- They include and also guarantee protection against fault currents:

- sinusoidal AC residual currents (AC type),
- pulsed DC residual currents (A type).

They can be adapted to all the application cases defined in standards IEC 60364 and EN 50178.

- Schneider Electric guarantees that the type B RCCB-ID works correctly in combination with the variable speed drives manufactured by Schneider Electric.

OFsp auxiliary

- Electrical indication: by OFsp auxiliary mounted to the left.
It has a double changeover switch indicating the "open" or "closed" position of the RCCB-ID B type.

Accessories

- 4P sealable screw shield.

Technical data

Electrical characteristics			
Insulation voltage (U _i)		400 V	
Pollution degree		3	
Rated impulse withstand voltage (U _{imp})		4 kV	
According to IEC/EN 61008-1			
Making and breaking capacity (I _m /I _{Δm})	25/40 A	500 A	
	63/80 A	800 A	
	125 A	1250 A	
Surge current withstand (8/20 μs) without tripping	No selective ☒	250 A	
	Selective ☑	3 kA	
Conditional rated short circuit current (I _{nc} /I _{Δc})	25/40 A with FU 80 A gG fuse	10,000 A	
	63 A with FU 100 A gG fuse	10,000 A	
	80/125 A with FU 125 A gG fuse	10,000 A	
Additional characteristics			
Degree of protection	Device only	IP20 IP40 with screw shield	
	Device in modular enclosure	IP40 Insulation class II	
Endurance (O-C)	Electrical	> 2 000 cycles	
	Mechanical	> 5 000 cycles	
Operating temperature		-25°C to +40°C	
Storage temperature		-40°C to +85°C	
Range of test button operating voltage	30 mA	2P	160...250 V AC
		4P	250...440 V AC
	100, 300, 500 mA	2P	185...250 V AC
		4P	185...440 V AC

Indication of the status of the RCCB-ID B type via the 3-position toggle and front panel indicator

- Closed (red indicator)
- Tripped on fault (green indicator)
- Open (green indicator)

Weight (g)

Type	RCCB-ID B type	OFsp
4P	450	40

Dielectric test

⚠ To perform the dielectric test, disconnect terminals 3, 5, 7 and 4, 6, 8.

Dimensions (mm)

Schneider Electric's range of add-on residual current devices consists of different products (A, B, C, D, E) to enable it to be the most competitive range possible in each country, allowing for the special characteristics of each market:

- usual installation procedure
- price
- accreditations by local bodies.

Variants

Offers		Pages
Offer A	Catalogue numbers	201 and 208
Offer B	Catalogue numbers	204 and 208
Offer C	Catalogue numbers	207 and 208
Offer D Quick Vigi	Catalogue numbers	209 and 215
Offer E Quick Vigi	Catalogue numbers	212 and 215
Common pages		17

Only the product range to be marketed in your country and validated by the local product manager, in agreement with his Final Distribution (FD) partner should be retained. The others will be removed before publication.

IEC/EN 61009-1

- Combined with iC60 circuit breaker, the Vigi iC60 provide:
 - protection of persons against electric shock by direct contact (≤ 30 mA),
 - protection of persons against electric shock by indirect contact (≥ 100 mA),
 - protection of installations against the risk of fire (300 mA or 500 mA).

- Combined with iC60 circuit breaker, the Vigi iC60 provide:
 - protection of persons against electric shock by direct contact (≤ 30 mA),
 - protection of persons against electric shock by indirect contact (≥ 300 mA),
 - protection of installations against the risk of fire (300 mA).

The **SI** type provides increased immunity from electrical interference and polluted or corrosive environments.

- protection of persons against electric shock by direct contact (30 mA),
- protection of persons against electric shock by indirect contact (≥ 300 mA),
- protection of installations against fire hazards (300 mA to 1000 mA).

Special feature of type SI

They are appropriate for operating in environments with:

- high risk of nuisance tripping: frequent lightning strikes, IT system, presence of electronic ballasts, frequency converters, presence of switchgear incorporating lighting type interference filters, computer system, etc.
- blind sources:
 - presence of harmonics or high frequency rejections
 - presence of DC components: diodes, diode bridges, switch-mode power supplies, etc.
- protected against nuisance tripping caused by transient voltage surges (lightning strike, operation of switchgear on the network, etc.)

Main characteristics

To IEC 60947-2

Insulation voltage (U _i)	500 V AC
Degree of pollution	3
Rated impulse withstand voltage (U _{imp})	6 kV

To EN 61009

Impulse current withstand (8/20 μs) without tripping	Types AC and A (non-selective ☒)	250 Å
	Types AC and A (selective ☒)	3 kÅ
	Types SI (non-selective ☒)	3 kÅ
	Types SI (selective ☒)	5 kÅ

Additional characteristics

Degree of protection	Device only	IP20
	Device in a modular enclosure	IP40
Operating temperature	Type AC	-5 °C to +60 °C
	Types A and SI	-25 °C to +60 °C
Storage temperature		-40 °C to +85 °C

Weight (g)

Add-on residual current devices

Type	Vigi C120
2P	325
3P	500
4P	580

Dimensions (mm)

C120 + Vigi C120

Vigi C120 add-on residual current devices (types AC, A and SI) (cont.)

Type SI

The *SI* type provides increased immunity from electrical interference and polluted or corrosive environments.

Schneider Electric's range of add-on residual current devices consists of different products (A, B) to enable it to be the most competitive range possible in each country, allowing for the special characteristics of each market:

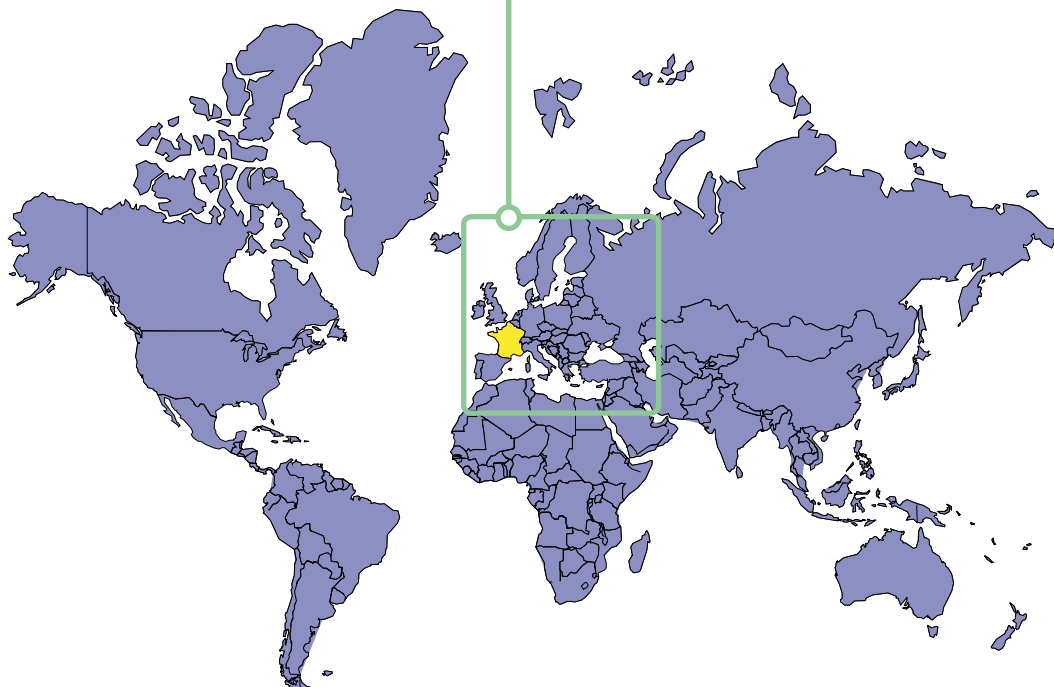

- usual installation procedure
- price
- accreditations by local bodies.

Variants

Offers		Pages
Offer A	Catalogue numbers	230
Offer B	Catalogue numbers	233
Common pages		236

Only the product range to be marketed in your country and validated by the local product manager, in agreement with his Final Distribution (FD) partner should be retained. The others will be removed before publication.

Vigi NG125 add-on residual current devices (SI type)

IEC/EN 61009-1

067484-40

■ When it is combined with an NG125 circuit breaker, the Vigi NG125 add-on residual current device offers the following functions:

- protection of persons against electric shocks by direct contact (30 mA),
- protection of persons against electric shocks by indirect contact (≥ 300 mA),
- protection of installations against fire risks (300 mA or 500 mA).

SI types are appropriate for operating in environments with:

- High risk of nuisance tripping: frequent lightning strikes, IT system, presence of electronic ballasts, frequency converters, presence of switchgear incorporating lighting type interference filters, computer system, etc.
- Blind sources
- presence of harmonics or high frequency rejections,
- presence of DC components: diodes, diode bridges, switch-mode power supplies, etc.
- Protected against nuisance tripping caused by transient voltage surges (lightning strike, operation of switchgear on the network, etc.).

Technical data

Main characteristics		
Insulation voltage (U _i)		690 V
Pollution degree		3
Rated impulse withstand voltage (U _{imp})		8 kV
According to IEC/EN 61009-1		
Surge current withstand (8/20 μs) without tripping	Selective <input type="checkbox"/> or R	5 kA
	Instantaneous	3 kA
Behaviour in case of voltage drop		Residual current protection down to 0 V according to IEC/EN 61009-1 § 3.3.8
Additional characteristics		
Degree of protection	Device only	IP20
	Device in modular enclosure	IP40
Operating temperature	AC type	-5°C to +60°C
	A and S/I types	-25°C to +60°C
Storage temperature		-40°C to +85°C
Additional characteristics		
Vigi 125 A and adjustable		
Plug-in auxiliaries	MXV	Remote tripping
	SDV	Indication of tripping upon earth fault
Adjustable Vigi		
Sensitivity adjustable by notch (IΔn)		300, 500, 1000, 3000 mA
Tripping time	Instantaneous	
	Selective <input type="checkbox"/>	60 ms
	Time-delayed	150 ms
Leakage current indication on 3P and 4P 300...3000 I/S/R (pre-alarm)		On front face by LED Remote, by potential-free normally-open contact 250 V - 1 A (low level) Threshold setting by potentiometer from 10 % to 50 % of IΔn
Disconnection essential for dielectric test		By integral pushbutton

- The iDPN Vigi residual current device provide complete protection for final circuits (against overcurrents and insulation faults):
 - protection for users against electric shocks by direct contacts (≤ 30 mA),
 - protection for users against electric shocks by indirect contacts (300 mA),
 - protection of the installations against fire risks (300 mA).

- The **SI** range has been designed to maintain a network with optimum safety and continuity of service in installations disturbed by:
 - extreme atmospheric conditions,
 - harmonic generating loads,
 - transient operating currents.

Main characteristics

Type	iDPNa Vigi	iDPN N Vigi	iDPN H Vigi
Insulation voltage (Ui)	400 V AC		
Pollution degree	3		
Rated impulse withstand voltage (Uimp)	4 kV		
Setting temperature for ratings	30°C		
Magnetic tripping	Curve B	Between 3 and 5 In	
	Curve C	Between 5 and 10 In	

According to IEC/EN 61009-1

Limitation class	3		
Rated breaking capacity (Icn)	4500 A	6000 A	10,000 A
Rated residual breaking and making capacity (IΔm)	4500 A	6000 A	10,000 A
8/20 μs impulse withstand	Type AC	250 Å	250 Å
	Type A	250 Å	250 Å
	Type S/	-	3 kÅ

Behaviour in case of voltage drop		Residual current protection down to 0 V according to IEC/EN 61009-1 § 3.3.8	
-----------------------------------	--	---	--

Additional characteristics

Earth leakage protection with instantaneous tripping		10, 30, 300 mA	10, 30, 100, 300 mA	30, 300 mA
Degree of protection (IEC 60529)	Device only	IP20		
	Device in modular enclosure	IP40		
Endurance (O-C)	Electrical	≤ 20 A	20,000 cycles	
		≥ 25 A	10,000 cycles	
	Mechanical	20,000 cycles		
Overvoltage category (IEC 60364)	III			
Operating temperature	Type AC	-5°C to +60°C		
	Type A, S/	-25°C to +60°C		
Storage temperature	-40°C to +85°C			
Tropicalization (IEC 60068-1)	Treatment 2 (relative humidity 95 % to 55°C)			

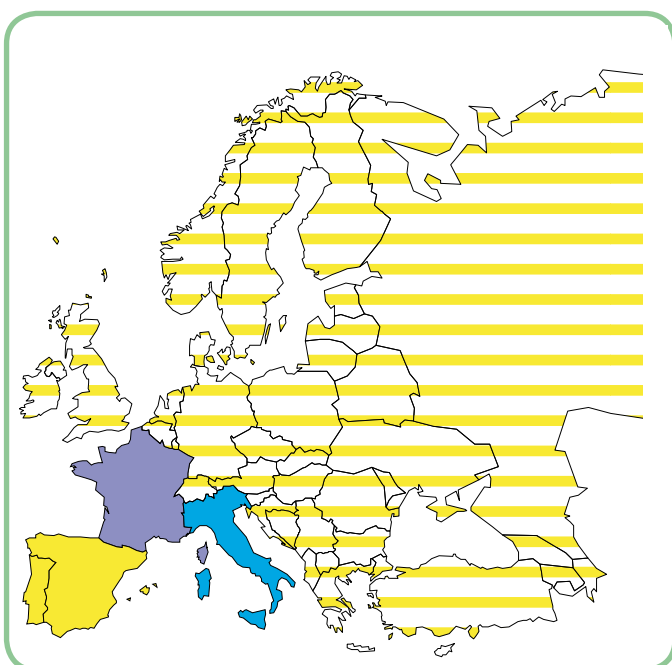

The Schneider Electric residual current device range comprises various offers (Clario, Prodis, Libro) so as to be as competitive as possible in each country, taking into account the specific features of each market:

- installation customs
- price
- approval by local organizations.

Variants

Offers		Pages
Common pages		246

Only the product range to be marketed in your country and validated by the local product manager, in agreement with his Final Distribution (FD) partner should be retained. The others will be removed before publication.

Vigi modules and residual current devices

Clario, Prodis, Libro

The Vigi module combined with a circuit breaker or the residual current device offers the following functions of earth leakage protection and circuit protection.

■ Earth leakage protection:

- protection of persons against electric shock by direct contact (30 mA),
- protection of persons against electric shock by indirect contact,
- protection of installations against the risk of fire.

■ Circuit protection:

- circuit protection against short-circuit currents,
- circuit protection against overload currents,
- disconnection.

Connection

Tightening torque	Copper cables	
	Rigid	Flexible or with ferrule
2 N.m	DB123945 0.75 to 16 mm ²	DB123946 0.33 to 10 mm ²

(*) 15 mm for DT40 Vigi K 3P+N (Prodis)

- Where there is a comb busbar tooth, the connection of cables of cross section 16 mm² remains possible.
- Outgoer connection:
 - upstream: direct by comb busbar,
 - downstream: by cables.
- Group Feeder connection:
 - upstream: by cables,
 - downstream: direct by comb busbar.

■ All Vigi modules that can be combined with circuit breakers have a rating foolproofing element preventing any combination on an inappropriate circuit breaker: in accordance with Annex G of the EN 61009-1 standard

"Group Feeder" Vigi modules
 ■ The downstream terminals are located in the upper part of the device for direct connection to the comb busbar

"Outgoer" Vigi modules
 ■ The downstream terminals are located in the lower part of the device

■ Every circuit breaker combined with a Vigi module remains compatible with the indication and tripping auxiliaries

The Schneider Electric residual current device range comprises various offers (A, B) to enable it to be the most competitive range possible in each country, allowing for the special characteristics of each market:

- usual installation procedure
- price
- accreditations by local bodies.

Variants

Offers		Pages
Offer A	Catalogue numbers	259
Offer B	Catalogue numbers	260
Common pages		261

Only the product range to be marketed in your country and validated by the local product manager, in agreement with his Final Distribution (FD) partner should be retained. The others will be removed before publication.

Country approval pictograms

IEC/EN 61009-1

- The DPN Vigi residual current device provides complete protection for final circuits (against overcurrents and insulation faults):
 - protection for people against electric shocks by direct contacts (30 mA),
 - protection for people against electric shocks by indirect contacts (300 mA),
 - protection of installations against risk of fire (300 mA).
- The *SI* range has been designed to maintain a network with optimum safety and continuity of service in installations disturbed by:
 - extreme atmospheric conditions,
 - harmonic generating loads,
 - transient switching currents.

SPN N Vigi

30 mA instantaneous, C curve
IEC 61009-2-2, AS/NZS 61009-1: 6000 A

Standards: IEC 61009-2-2, AS/NZS 61009-1.

- The single-phase SPN N Vigi self-contained residual current device carries out:
 - protection of persons against direct and indirect contacts (30 mA)
 - complete protection of final circuits (overcurrents and insulation faults)
 - safety device to switch both of active and neutral
- A class SPN N Vigi are sensitive to the pulsed type DC component.
- Overload, short circuit and earth fault currents are indicated by location of the handle in the OFF position.
- A push-test button "T" is positioned on the front of the device for testing that product is operational.

Accessories

Padlocking device

- Used to lock the toggle in the "open" or "closed" position by 8 mm diameter padlock (not supplied).

1P+N comb busbars

- The comb busbars make it easier to install Schneider Electric products.

The REDs and the REDtest, **RE**sidual current **D**evice recloser, is made up of a residual current device and a recloser.

The **REDs** and **REDtest RESidual current Devices** offer the following functions:

- protection of people against direct and indirect contacts
- protection of installations against insulation faults
- disconnection of on-load electric circuits, already protected against overloads and short-circuits
- automatic restart after insulation monitoring of the downstream circuit.

REDtest provides the following additional functions:

- automatic and periodical test of the device, without breaking downstream circuit (REDtest).

Only used on TT and TN-S earthing grounding systems.

Operation

REDs

The REDs operates in the residual current device mode, without automatic restart, when the sliding cover is open, i.e. to the right in the Auto Off position (Fig. 1).

The automatic restart mode and the Autotest are activated, when the sliding cover is closed, i.e. to the left in the Auto On position (Fig. 2).

Test

⚠ This is only possible in manual mode, i.e. sliding cover open in the Auto Off position. You can then manually test the device by pressing the Test key. The downstream installation is then temporarily broken. You must then manually reclose the RED by activating the O-I lever to power supply the downstream circuit.

Fig. 1

Fig. 2

REDtest

■ The REDtest carries out automatic testing of earth leakage protection every months.

The test consists in opening and reclosing the REDtest, during which time continuity of supply of the downstream installation is guaranteed.

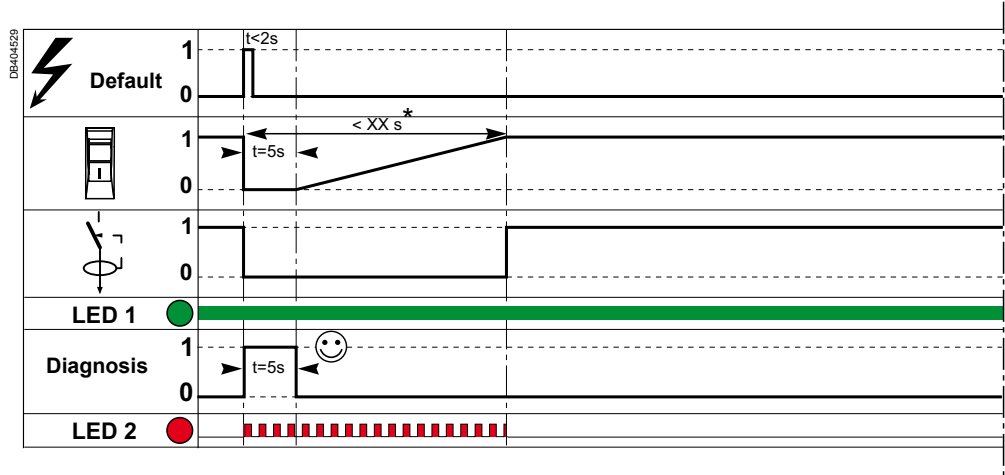

Autotest: after checking installation insulation, the REDtest monitors its residual current device, without breaking the downstream power supply (bypass by bypass contact).

REDs, REDtest

Operation ON mode: temporary network fault REDs, REDtest

(*) Reclosing time:
 REDtest 2P: 10 s
 REDs 2P: 90 s
 REDs 4P: 10 s

The built-in automatic recloser automatically recloses the residual current device after checking insulation of the downstream circuit.

Rd: lower level of insulation resistance, if $R < R_d$ = no reclose
 Rdo: higher level of insulation resistance, if $R_d > R_{do}$ = reclose

$I_{\Delta n}$	30 mA	300 mA
Rd	8 k Ω	2.5 k Ω
Rdo	16 k Ω	5 k Ω

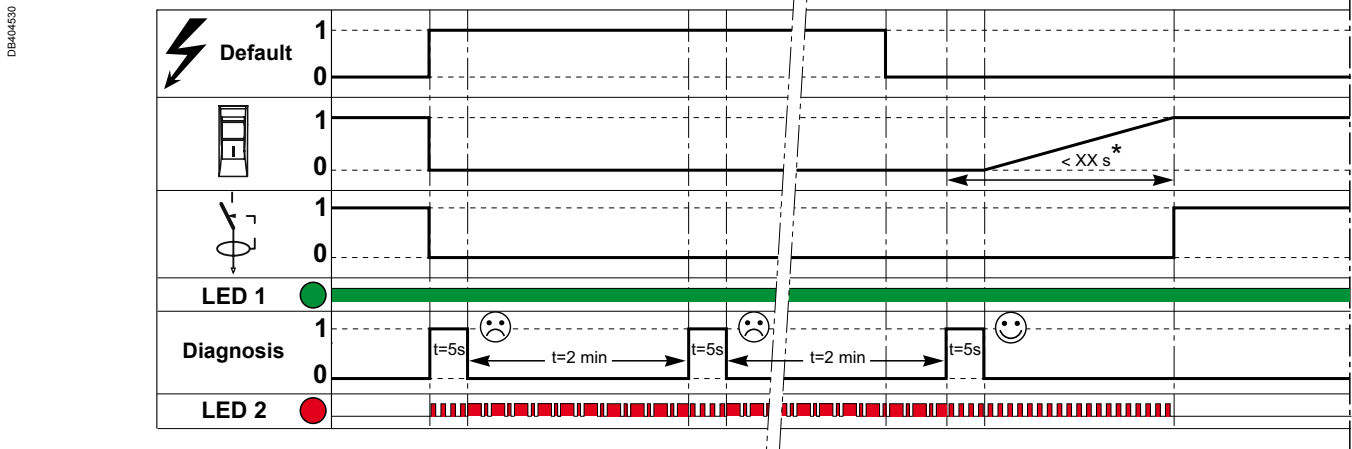

Operation ON mode: long network fault

REDs

If the circuit is faulty, the switch is prohibited from reclosing. After a time delay of 2 minutes, the downstream circuit insulation is rechecked.

There are then two possibilities:

- the installation is still faulty (the resistance to earth is lower than Rd): in this case a new check will be carried out in 2 minutes.
- the fault was temporary and has disappeared (the resistance to earth is higher than Rdo): the recloser automatically recloses the REDs.

(*) Reclosing time:
 REDs 2P: 90 s
 REDs 4P: 10 s

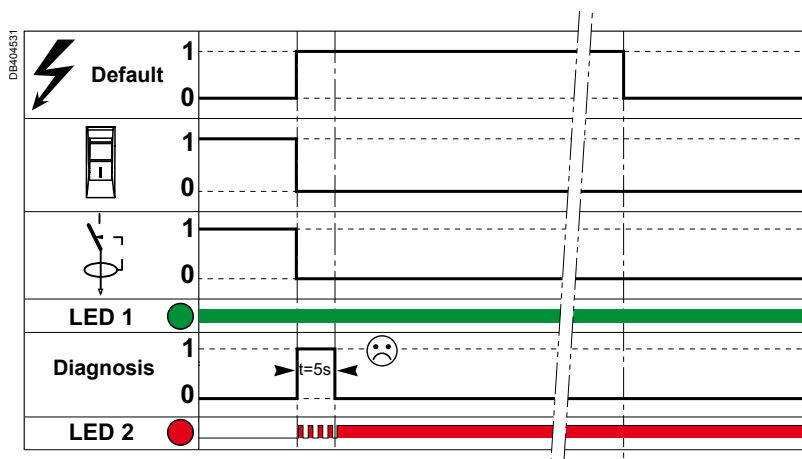

IΔn	30 mA
Rd	20 k Ω
Rdo	70 k Ω

Operation ON mode: long network fault (cont.)

REDtest

If the circuit is faulty for a length of time "greater than 5 seconds", the switch is prohibited from reclosing.

- The installation is faulty: the earth resistance is lower than Rd.

iARC reduces the risk of electrical fires. By continuously analysing a large number of electrical parameters, it detects the appearance of electric arcs that are responsible for starting fires. It automatically isolates the circuit concerned before the first flame appears. In residential installations, iARC is particularly suitable for protecting circuits where the risk of fire is highest:

- bedroom and living room socket circuits that are live, unattended power outlets
- circuits susceptible to be damaged (surface-mounted, outdoor installation, etc.).

IEC 62606

General requirements for arc detection devices.

■ iARC monitors electric arcs that occur in cables and connections and cause a fire. These arcs are the result of localised cable deterioration or loose connections

■ It is used for three types of situations that can result in a fire:

- parallel arc detection: insulation problems between two live conductors that cause a resistive short-circuit, too weak to be detected by a circuit breaker and with no earth leakage that would be detected by an earth-leakage protection device,
- series arc detection: a damaged conductor or connection that causes part of the current to pass into its carbonised insulation due to a local rise in temperature,
- overheating of electronic components in loads, when exposed to an overvoltage for several seconds.

■ It combines the following functions:

- protection against fire hazards by detection of abnormal electric arcs,
- protection against load fire hazards due to slow overvoltages,
- circuit opening and positive break indication (green strip),
- fire hazard tripping indication via the front panel indicator,
- device self-diagnostics via the test button.

■ Installed in series with a circuit breaker or RCBO (DPN Vigi), max. 25 A, it protects Phase-Neutral or Phase-Phase circuits, in full coordination under short-circuit conditions up to a rated breaking capacity (Inc) of 10,000 A.

Fire prevention

The iDPN N Arc circuit breaker reduces the risk of electrical fires. By continuously analysing a large number of electrical parameters, it detects the appearance of electric arcs that are responsible for starting fires. It automatically isolates the circuit concerned before the first flame appears. In residential installations, it is particularly suitable for protecting circuits where the risk of fire is highest:

- bedroom and living room socket circuits that are live, unattended power outlets
- circuits susceptible to be damaged (surface-mounted, outdoor installation, etc.).

IEC/EN 60898-1

Circuit breakers for the protection against the overload (residential and similar installations).

IEC 62606

General requirements for arc detection devices.

- In addition to protection against overloads and short-circuits, the iDPN N Arc monitors for electric arcs that occur in cables and connections, that may cause a fire. These arcs are the result of localised cable deterioration or loose connections.
- It is used for three types of situations that can result in a fire:
 - parallel arc detection: insulation problems between two live conductors that cause a resistive short-circuit, too weak to be detected by a circuit breaker and with no earth leakage to be detected by a residual current circuit breaker,
 - series arc detection: a damaged conductor or connection that causes part of the current to flow through its carbonised insulation due to a local rise in temperature,
 - overheating of electronic components in loads, when exposed to an overvoltage for several seconds.
- It combines the following functions:
 - circuit protection against overload and short-circuit currents (circuit breaker function),
 - protection against fire hazards by detection of abnormal electric arcs,
 - protection against load fire hazards due to slow overvoltages (network overvoltage),
 - fire hazard tripping indication via the front panel indicator,
 - device self-diagnostics via the test button,
 - positive contact indication (green strip).

iPRF1 12.5r/PRD1 35r/ PRD1 25r/PRD1 Master Type 1 and 2 LV surge arresters

The Type 1 range of surge arresters meets the normative withstand capability of current wave type 10/350 μ s (8/20 μ s for Type 2 surge arresters).

It is suitable for use with TT, TN-S, TN-C and IT earthing connection systems (neutral point connection).

In addition, the PRD1 35r surge arrester covers the 400 V IT system.

iPRF1 12.5r and PRD1 surge arresters are fitted with a remote transfer contact to send "end-of-life indication" information.

PRD1 surge arresters are fitted with easy-to-replace withdrawable cartridges.

iPRF1 12.5r/PRD1 35r/PRD1 25r/PRD1 Master

The Type 1 surge arrester is recommended for electrical installations in the service sector and industrial buildings protected by a lightning conductor or by a meshed cage.

It protects electrical installations against direct lightning strikes.

It is used to conduct the direct lightning current, propagating from the earth conductor to the network conductors.

It must be installed with an upstream disconnection device, such as a fuse or circuit-breaker, whose breaking capacity must be at least equal to the maximum prospective short-circuit current at the installation point.

iPRF1 12.5r and PRD1 25r surge arresters also provide Type 2 protection and protect the electrical installation by finely clipping the lightning wave overvoltages.

The iPF multi-pole single-piece surge arrester range is adapted for earthing systems: TT, TN-S, TN-C.

Type 2 surge arresters are tested with a 8/20 μ s current wave.

Type 3 surge arresters are tested with a 12/50 μ s and 8/20 μ s combined wave.

Each surge arrester in the range has a specific application:

■ **incoming protection (type 2):**

- the iPF65(r) is recommended for a very high risk level (strongly exposed site)
- the iPF40(r) is recommended for a high risk level
- the iPF20 is recommended for a medium risk level

■ **secondary protection (type 2 or 3):**

- the iPF8 ensures secondary protection of loads to be protected and is placed in cascade with the incoming surge arresters. This surge arrester is required when the loads to be protected are at a distance of more than 30 m from the incoming surge arrester.

The iPF surge arresters with “r” indication have remote transfer of the information: “surge arrester to be replaced”.

Dimensions (mm)

Each surge arrester in the range has a specific application:

■ **incoming protection (type 2):**

- the iPF K 65 is recommended for a very high risk level (strongly exposed site),
- the iPF K 40 is recommended for a high risk level,
- the iPF K 20 is recommended for a medium risk level.

The iPF K multi-pole single-piece surge arrester range is adapted for earthing systems: TT, TN-S, TN-C.

Type 2 surge arresters are tested with a 8/20 μ s current wave.

1P	125
1P+N	210
3P	335
3P+N	420

Dimensions (mm)

iPRD withdrawable surge arresters allow quick replacement of damaged cartridges.
Type 2 surge arresters are tested with a 8/20 μ s current wave.
Type 3 surge arresters are tested with a 1.2/50 μ s and 8/20 μ s combined wave.

Each surge arrester in the range has a specific application:

■ **incoming protection (type 2):**

- the iPRD65r is recommended for a very high risk level (strongly exposed site)
- the iPRD40(r) is recommended for a high risk level
- the iPRD20(r) is recommended for a medium risk level

■ **secondary protection (type 2 or 3):**

- the iPRD8(r) ensures secondary protection of loads to be protected and is placed in cascade with the incoming surge arresters. This surge arrester is required when the loads to be protected are at a distance of more than 10 m from the incoming surge arrester.

The iPRD surge arresters with “r” indication have remote transfer of the information: “cartridge to be replaced”.

Dimensions (mm)

Withdrawable surge arrester iQuick PRD Type 2 or Type 3

Withdrawable surge arrester iQuick PRD allow damaged cartridges to be replaced quickly. They offer remote reporting of the "cartridge must be changed" message.

EN 61643-11: 2012 Type 2, IEC 61643-11: 2011 T2

They protect electrical and electronic equipment against lightning-induced surges. Withdrawable surge arrester iQuick PRD surge arresters are prewired, incorporating their end-of-life disconnecter.

Each surge arrester in the range has a specific use:

■ **incoming protection (type 2):**

- iQuick PRD40r is recommended for a high risk level
- iQuick PRD20r is recommended for a moderate risk level

■ **secondary protection (type 2 or 3):**

- iQuick PRD8r provides secondary protection for the loads to be protected and is cascade-mounted with the incoming surge arresters. This surge arrester is required as close as possible to the loads to be protected when they are located more than 30 metres away from the incoming surge arrester.

Replacement cartridges.

Dimensions (mm)

The iQuick PF multi-pole single-piece surge arrester range is adapted for earthing systems: TT, TN-S. Type 2 surge arresters are tested with a 8/20 μ s current wave.

EN 61643-11: 2012 Type 2, IEC 61643-11: 2011 **T2**

Protects electrical and electronic equipment against indirect overvoltage due to the lightning effect.

Coordination with selective version "SI" and **SI** types.

The iQuick PF is precabled. It incorporates its end of life safety disconnecter and an earthing terminal block.

Accessories supplied

- Terminal and 16 mm² cable for connection to the earth bar of the enclosure (supplied mounted).
- 1 lug to crimp for 16 mm² earthing cable.
- iQuick PF 1P+N: 2 connection accessories for the electrical link between the surge arrester and the incoming residual current circuit breaker:
 - 1 mounted, centre distance between axes: 9 mm,
 - 1 supplied, centre distance between axes: 18 mm.

Country approval pictograms

Protection against overvoltages related to lightning strikes.

Analogue telephone line protection: the iPRC surge arrester wired in series to the private installation input protects the telephones, the PABX, the modems (including ADSL), etc.

Protection for 2 low-current lines without common potential or 4 lines with common reference potential: the iPRI protects the measuring instrument and PLC "sensor" inputs and the DC power supply inputs up to 53 V and AC power supply inputs up to 37 V. The input current must not exceed 300 mA.

Maximum continuous operating voltage (U_{OPV})	iPRD 40r 800PV	800 V	
	iPRD 40r 1000PV	1000 V	
Response time	< 25 ns		
Permanent operating current (I_c)	< 1 mA		
Short circuit current (I_{SCPV})	200 A		
Type of surge arresters	Type 2		
Ground residual current	I_{PE} (AC)	600 μ A	
	I_{PE} (DC)	60 μ A	
End-of-life indication mode	Circuit opened by integrated thermal disconnecter		
Additional characteristics			
Degree of protection (IEC 60529)	Device only	IP20	
	Device in modular enclosure	IP40	
	Chocs	IK03	
Satisfactory operation indication	By the cartridges	White	Operational
		Red	Cartridge must be replaced
		By the NO/NC remote indication contact 250 V AC / 0.25 A	
Operating temperature	-25°C to +60°C		
Storage temperature	-40°C to +85°C		
Humidity range	5 % to 95 %		
Standards	UTE C 61740-51 [T2] EN 50539-11: 2013 [T2]		

Weight (g)

Surge arresters	
Type	Weight (g)

Dimensions (mm)

Schneider Electric's range of switches consists of different products (A, B) to enable it to be the most competitive range possible in each country, allowing for the special characteristics of each market:

- usual installation procedure
- price
- accreditations by local bodies.

Variants

Offers		Pages
Offer A	Catalogue numbers	317, 319
Offer B	Catalogue numbers	318, 320
Common pages		321

Only the product range to be marketed in your country and validated by the local product manager, in agreement with his Final Distribution (FD) partner should be retained. The others will be removed before publication.

IEC/EN 60947-3

The switch-disconnectors combine the following functions:

- Control (opening and closing of circuits under load).

iOF auxiliary

- Mounted on the left, it indicates the "open" or "closed" position of the switch and has a normally open (NO) or normally closed (NC) contact.

Switch-disconnectors remote tripping types iSW-NA

Positive break indication

- Suitability for isolation in the industrial sector to IEC/EN 60947-3.
- The presence of the green strip guarantees that the contacts open physically and allows work to be carried out safely on the downstream circuit.

IEC/EN 60947-3

The iSW-NA trip switch-disconnectors combine the following functions:

- control (opening and closing of circuits under load)
- isolation.

They are designed for switchboard or cubicle incoming units in the tertiary and industry sectors, with the possibility of remote tripping via a coil.

DB123493

For rating ≥ 80 A

- Voltage taps:
 - auxiliaries power supply
 - measurement
 - emergency stop
 - remote reporting

■ Cable strength:

- ribbed cage
- terminal depth
- tightening by Allen hex key (NG125 ≥ 80 A)

■ Integrated padlocking device

■ Test button to check satisfactory operation of the tripping mechanism

■ Pull-out strength:

- metallic lock

■ Impact and vibration resistance:

- high-strength enclosure
- IK 05

■ Central manual control, 3 positions:

- ON
- tripped on fault
- open

■ Circuit breaker tripped indicator

■ Positive contact indication:

- suitability for isolation in the industrial sector to IEC/EN 60947-3;
- the presence of the green strip guarantees that the contacts open physically and allows work to be carried out safely on the downstream circuit.

■ Longer product service life due to:

- good overvoltage withstand capacity;
- high limitation performances;
- fast closure independent of the speed of actuation of the toggle.

Indication auxiliaries: respect specified position for SD functions.

iSW-NA: when installing a tripping device (iMN, iMX, iMSU...), an iSD

auxiliary contact must be associated, which indicates that the iSW-NA has been tripped open.

Assembly rule

The mounting order and the number for the various auxiliaries must be complied with.

The tripping auxiliaries (iMN, iMX, iMSU...) should be mounted first **1** as close as possible to the main device.

Then at the left, the indicating auxiliaries (iOF, iSD) should be mounted **2** then **3** complying with the following association table.

Indicating auxiliaries 3	+ 2	Tripping auxiliaries + 1	Remote control	Device	Vigi iC60

Indication		
3	SD fault indicating switch	A9N26927
4	OF+SD24 auxiliary contact	A9N26899
5	OF open/closed contact	A9N26924
6	OF+SD/OF auxiliary contact (OF+SD or OF+OF combination switch)	A9N26929

Tripping		
1	MN, MNx, MN \square undervoltage release	See module CA907008
2	MX, MX + OF shunt release	See module CA907008

Tripping devices must be installed first.
If two tripping devices are used: the MN must be installed first
Indication auxiliaries: respect specified position for SD functions.

Assembly rule

The mounting order and the number for the various auxiliaries must be complied with.

The tripping auxiliaries MN, MX...) should be mounted first **1** as close as possible to the main device.

Then at the left, the indicating auxiliaries (OF, SD) should be mounted **2** then **3** complying with the following association table.

Indicating auxiliaries 3		Indicating auxiliaries + 2		Indicating auxiliaries + 1		Device
1 (OF+SD/OF or OF+SD24)		1 OF+SD/OF		1 (MN, MNx, MN \square or MX, MX+OF)		
1 OF		1 (OF+SD/OF or SD or OF)		2 (MN, MNx, MN \square or MX, MX+OF)		
-		1 OF+SD24		2 (MN, MNx, MN \square or MX, MX+OF)

		Connection				
Accessories	Multi-cable terminal	50 mm ² Al terminal	Screw-on connection for ring terminal	Connection kit for ring terminals	Terminal for rear connector	
						
Function		For 3 copper cables: ■ Rigid up to 16 mm ² ■ Flexible up to 10 mm ²	For 16 to 50 mm ² aluminium cables	For lug tipped cables, front or rear mounting	For terminal up to 63 A, front or rear access (screw Ø 5 mm) ■ It incorporates a "conductive" part and an "insulating" part which ensures the phase-to-phase clearance	For cable up to 50 mm ² or by terminal ■ Supplied with a 1P terminal shield

Description

- Downstream circuits are connected from the front, to spring terminals.
- Contact pressure automatically adapts to the size of the conductor.
- Contacts are insensitive to vibrations and thermal variations.
- Only one cable (flexible or rigid) can be inserted per terminal.

Description

- Distribution over full rows of modular devices.
- The distribution block is generally supplied by busbars in enclosures and cubicles.
- Easy phase balancing.
- Mix of devices and functions in the same row.
- Installation ≥ 160 A: clipped onto the back of a modular rail or screwed onto a solid or pre-slotted plate.

IEC/EN 60947-7-1, IEC/EN 61439-1 & 2

Description

- Single-pole or four-pole distribution block that can be installed on a standard DIN rail or on a mounting plate.
- Compatible with Prisma G and P, Pragma, Mini Pragma and Resbo series switchboards.
- Incomers and feeders are connected to screw terminals that accept rigid or flexible cables with ferrule.
- Optional: additional neutral terminal strip for four-pole distribution block.

Advantages

- Simplified power supply for main incomers.
- Easy phase balancing.
- Easy, effortless cabling due to excellent accessibility.
- Visible cabling.
- Insulation between phases.
- The single-pole distribution blocks are adjacent and bridgeable via the second incoming hole for parallel connection.

IEC/EN 61131-2

Acti 9 Smartlink Modbus Slave and Acti 9 Smartlink Ethernet are used to transfer data from Acti 9 devices to a PLC or monitoring system via the communication system:

- Modbus serial line for Acti 9 Smartlink Modbus Slave
- Modbus Ethernet TCP/IP or http for Acti 9 Smartlink Ethernet.

Functions

Data transmission between the network and Acti 9 devices

- Circuit breakers, residual current circuit breakers, residual current devices:
 - open/closed state
 - tripped state
 - number of opening/closing cycles
 - number of tripping actions.
- Contactors, impulse relays:
 - opening control
 - closing control
 - open/closed state
 - number of opening/closing cycles
 - total period of operation of the load (device closed).
- Remote controlled circuit breaker/Reflex iC60:
 - opening control
 - closing control
 - open/closed state
 - tripped state
 - number of opening/closing cycles
 - total period of operation of the load.
- Power meters:
 - number of pulses recorded
 - pulse value setting (e.g. kWh)
 - total consumption recorded
 - estimate of power consumption.
- Analog sensors only for Acti 9 Smartlink Ethernet:
 - temperature sensor
 - humidity sensor,
 - CO₂ detector,
 - optical detector
 - ...

All the data are stored in memory: number of cycles, consumption, period of operation, even in the event of a power failure.

Acti 9 Smartlink can also exchange data with any device having 24 V DC digital inputs/outputs.

No configuration of the connected products is required.

When Acti 9 Smartlink is switched on, communication automatically adjusts to the Modbus Master or Ethernet (PLC, control station) communication parameters.

Installation

- Mounting in switchboards:
 - width 24 modules per row
 - minimum spacing between rails 150 mm.
- Mounting on
 - DIN rail, with mounting kit **A9XMFA04**
 - Linergy FM 80 A, with locking clips supplied
 - Linergy FM 200 A, with mounting kit **A9XM2B04**.

Test

- The communication and cabling test for the connected devices can be performed using Acti 9 Smart Test software

PB107197-47

DE404802

Acti 9 Smart Test software

- Electrical continuity test
- Functional testing of the devices
- Report printing
- Printing of a simplified diagram
- Project archiving
- Compatible with Windows XP, Windows 7, Windows 8
- To be download on: Schneider Electric web sites:
 - schneider-electric.com or
 - schneider-electric country web site

Capacity		2 ³² pulses per input
Input characteristics		
Number of channels	Acti 9 Smartlink Modbus Slave	11 of 2-input channels
	Acti 9 Smartlink Ethernet	7 of 2-input channels
Type of input		Current collector Type 1 IEC 61131-2
Maximum cable length		500 m
Rated voltage		24 V DC
Voltage limits		24 V DC \pm 20 %
Rated current		2.5 mA
Maximum current		5 mA
Filtering time	In state 1	2 ms
	In state 0	2 ms
Isolation		No isolation between channels
Negative sequence voltage protection		Yes
Output characteristics		
Number of output channels	Acti 9 Smartlink Modbus Slave	11
	Acti 9 Smartlink Ethernet	7
Type of output		24 V DC 0.1 A current source
Maximum cable length		500 m
Rated voltage	Voltage	24 V DC
	Maximum current	100 mA
Filtering time	In state 1	2 ms
	In state 0	2 ms
Voltage drop (voltage in state 1)		1 V max
Maximum inrush current		500 mA
Leakage current		0.1 mA
Overvoltage protection		33 V DC
Environmental characteristics		
Temperature	Operating	-25°C ... +60°C (if vertical mounting, limited to 50°C)
	Storage	-40°C...+80°C
Tropicalization		Treatment 2 (relative humidity of 93% at 40°C)
Resistance to voltage dips		10 ms, class 3 as per IEC 61000-4-29
Degree of protection		IP20
Pollution degree		3
Altitude	Operating	0 ... 2000 m
Vibration resistance	As per IEC 60068.2.6	1 g / \pm 3.5 mm - 5 Hz to 300 Hz - 10 cycles
Shock resistance	As per IEC 60068.2.2 7	15 g / 11 ms
Immunity to electrostatic discharge	As per IEC 61000-4-2	Air: 8 kV Contact: 4 kV
Immunity to radiated magnetic fields	As per IEC 61000-4-3	10 V/m - 80 MHz to 3 GHz
Immunity to fast transients	As per IEC 61000-4-4	1 kV for inputs/outputs and Modbus communication. 2 kV for 24 DC power supply - 5 kHz - 100 kHz
Immunity to conducted magnetic fields	As per IEC 61000-4-6	10 V from 150 kHz to 80 MHz
Immunity to magnetic fields at mains frequency	As per IEC 61000-4-8	30 A/m
Resistance to corrosive atmospheres	As per IEC 60721-3-3	Level 3C2 on H ₂ S / SO ₂ / NO ₂ / Cl ₂
Fire resistance	For live parts	At 960°C 30 s / 30 s as per IEC 60 695-2-10 and IEC 60 695-2-11
	For other parts	At 650°C 30 s / 30 s as per IEC 60 695-2-10 and IEC 60 695-2-11
Salt spray test	As per IEC 60068.2.52	Severity 2
Environment		In compliance with the RoHS directive
Additional characteristics		
Duration of saving memory		10 years
Prefabricated cables characteristics		
Dielectric resistance		1 kV / 5 min
Minimum draw-out resistance		20 N

Acti 9 Smartlink Modbus Slave technical characteristics

Characteristics of the Modbus link		
Link	Modbus, RTU, RS485 serial connection	
Transmission	Transfer rate	9600 baud ... 19200 baud, self-adaptable
	Medium	Shielded cable, double twisted pair
Protocol	Master/Slave	
Type of device	Slave	
Modbus addressing range	1 to 99	
Maximum length of the bus	1000 m	
Type of bus connector	4-pin connector	

Acti 9 Smartlink Ethernet technical characteristics

Characteristics of the Ethernet link		
Link	10/100 MB Ethernet	
Protocol	Modbus TCP server http (Web pages)	
Address mode	Static and dynamic (supplied, by default, in dynamic mode)	
Characteristics of Gateway		
Protocol	Modbus TCP/IP -> Modbus SL	
Modbus slave number	8	
Modbus addressing range	1 to 247	
Characteristics of the Modbus Master link		
Link	Modbus serial connection, RTU, RS485	
Transmission	Transfer rate	9600 baud ... 19200 baud, self-adaptable
	Support	Shielded cable, double twisted pair
Maximum length of the bus	1000 m	
Type of bus connector	4-pin connector	
Characteristics of the analog inputs		
Number	2	
Type	Separate configuration for each input, either 0-10 V or 4-20 mA	
Measuring accuracy	1/100 full scale	
Resolution	12 bits	
Acquisition time	500 ms	
Isolation	No isolation between channels	
Power supply	0-24 V DC	
Type of cable	Shielded cable, double twisted pair	
Maximum cable length	30 m	
Protection	Short-circuit protection

- The electrical auxiliaries are combined with iC60 circuit breakers, iID residual current circuit breakers, remote tripping switch disconnectors iSW-NA; they enable tripping or remote indication of their position (open/closed/tripped) upon a fault.
- They are fastened by clips (without tools) to the left side of the breaker.
- The iOF/SD+OF auxiliary is a 2-in-1 product: via a mechanical selector switch, it provides two contacts, OF+SD or OF+OF.
- The iOF+SD24 auxiliary can report open/closed (OF) status information and intentional or fault tripping of the associated device (SD) to the Acti 9 Smartlink or a programmable logic controller via the Ti24 interface (24 V DC).

Tripping auxiliaries:

IEC/EN 60947-1

- iMN: undervoltage release
- iMNs: delayed undervoltage release
- iMNx: undervoltage release, independent from supply voltage
- iMX: shunt release
- iMX+OF: shunt release with open/close contact.

EN 50550

- iMSU: overvoltage release.

Indication auxiliaries:

IEC/EN 60947-5-1

- iOF: open/close contact
- iSD: fault indicating contact
- iOF/SD+OF: open/close contact and switchable OF or SD contact
- iOF+SD24: open/close contact OF and default indicating contact SD with Ti24 interface.

IEC/EN 60947-5-4

- iOF+SD24: open/close contact OF and default indicating contact SD with Ti24 interface.

iMDU electrical auxiliary for Reflex iC60

A9C18195

The voltage matching module allows safety voltages of 24 and 48 V AC/DC to be used on the control inputs.

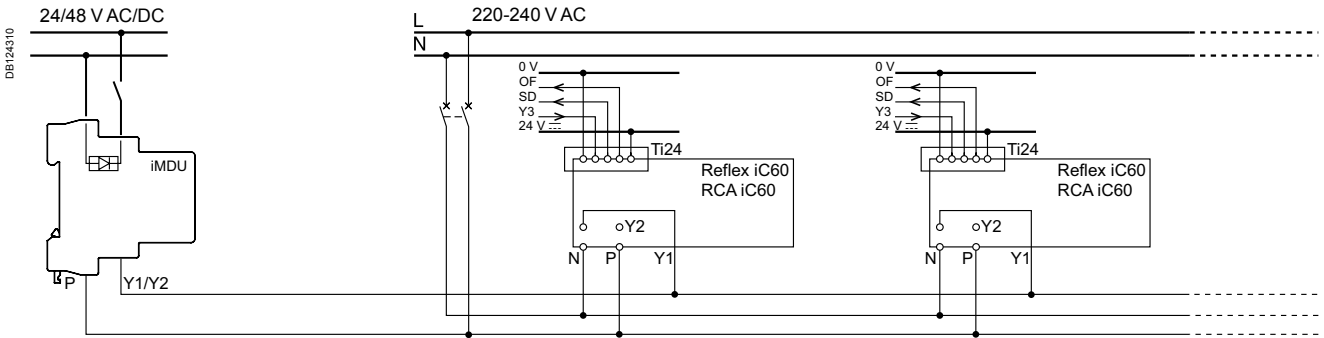

- Only connects to the Reflex iC60 circuit breakers remote controlled by a 220-240 V control voltage
- Galvanic isolation 6000 V
- Maximum combined power between terminals P and Y1/Y2: 100 mA at 230 V and 25°C.

Technical data

Main characteristics		
Control circuit voltage	24...48 V AC/DC	
Insulation voltage (Ui)	500 V	
Additional characteristics		
Degree of protection (IEC 60529)	Device only	IP20
	Device in modular enclosure	IP40 Insulation class II
Operating temperature	-20°C to +60°C	
Storage temperature	-40°C to +80°C	
Tropicalisation	Treatment 2 (relative humidity 95 % at 55°C)	
Weight	53 g	

- The electrical auxiliaries provide the remote tripping or position (open/closed/tripped) indication functions of these devices in the event of a fault.
- They clip on (no tool required) to the left-hand side of the associated device.
- The OF+SD/OF auxiliary is a two-in-one product: a mechanical selector switch is used to select one of two contacts: OF+SD or OF+OF.
- The OF+SD24 auxiliary can report open/closed (OF) status information and intentional or fault tripping of the associated device (SD) to the Acti 9 Smartlink or a programmable logic controller via the Ti24 interface (24 V DC).

- The electrical auxiliaries are not compatible with ID residual current circuit breakers of type B.

Tripping auxiliaries:

IEC/EN 60947-1

- MN: undervoltage release
- MN $\overline{\text{I}}$: delayed undervoltage release
- MNx: undervoltage release, independent of the supply voltage
- MX: shunt release
- MX+OF: shunt release with open/closed contact.

EN 50550

- MSU: overvoltage release.

Indication auxiliaries:

IEC/EN 60947-5-1

- OF.S: open/closed contact for ID
- OF: open/closed contact
- SD: fault indicating contact
- OF+SD/OF: choice of open/closed contact and OF or SD contact via the selector switch
- OF+SD24: open/close contact OF and cfault indicating contact SD with Ti24 interface.

IEC/EN 60947-5-4

- OF+SD24: open/close contact OF and cfault indicating contact SD with Ti24 interface.

- The electrical auxiliaries are combined with NG125 circuit breakers and NG125 switch-disconnectors; they provide the remote tripping or position (open/closed/tripped) indication functions of these devices in the event of a fault.
- They clip on (no tool required) to the left-hand side of the associated device.

IEC/EN 60947-2

- Tripping auxiliaries:
 - MN: undervoltage release
 - MNx: undervoltage release, independent of the supply voltage

The RCA remote control system allows:

- Remote electrical control (opening and closing) of circuit breakers with or without Vigi add-on RCD, with or without auxiliary.
- Circuit-breaker resetting after tripping, in accordance with safety principles and the regulations in force.
- Local control by operating handle.
- Circuit placing in safety configuration by padlocking.

2 choices of operation after tripping:

- A: Enabling of remote circuit-breaker resetting;
- B: Inhibition of remote resetting.

The version with Ti24 interface allows:

- Direct interfacing of remote control with a programmable logic controller (PLC), a supervision system and any other communication device, having inputs/outputs in 24 V DC (control, OF and SD indications).
- Fast, reliable connection of the remote control to the Acti 9 Smartlink thanks to the prefabricated cables.
- Remote indication by "OF" potential-free contact.
- Provision of 2 operating modes, "1 and 3".

The iMDU auxiliary allows RCA control in 24/48 V AC/DC.

ARA automatic reclosers

For iC60 circuit breakers
and iID residual current circuit breakers

ARA iC60

ARA iID

The ARA reclosing auxiliary can:

- Perform automatic reclosing of the associated protection device, after tripping.
- Increase the availability of installations without supervision, isolated, hard of access and demanding very great availability (mobile telephony systems, motorways, pumping stations, airports, railways, meteorological stations, service stations, automatic teller machines, public lighting, tunnels, etc.), by restoring them to operation without intervention by personnel in the event of a transient fault (atmospheric disturbances, industrial overvoltages, etc.).
- For the ARA iC60, the operator can choose predefined reclosing program which allows the safety and availability of facilities to be reconciled taking into account the facility's environment.
- The circuit is placed in safety configuration by the padlocking device.

ARA automatic reclosers (cont.)

For iC60 circuit breakers

and iID residual current circuit breakers

Operating principle

The ARA automatic recloser makes a number of attempts at reclosing depending on the program chosen by the user.

The program includes the following settings:

- A time delay before reclosing (TA).
- A reinitialization time delay (TB).
- A maximum number of reclosing attempts.

If, following these attempts, the fault is still present, the device places itself in waiting for manual reclosing, or final remote reclosing (Y2).

IEC/EN 60947-2

The Reflex iC60 devices are integrated control circuit breakers which combine the following main functions in a single device:

- Remote control by latched and/or impulse-type order according to the 3 operating modes to be chosen by the user.
- Circuit breaker, to provide:
 - circuit protection against short-circuit currents,
 - circuit protection against overload currents,
 - disconnection in the industrial sector.

Resetting after a fault is performed manually, by the resetting handle.

The Ti24 interface allows direct interfacing of the Reflex iC60 with a PLC, to:

- Execute remote control (Y3).
- Indicate the state of the control circuit (O/C) and circuit-breaker state information (auto/OFF).
- Connect in a fast way and sure the Reflex iC60 to the Acti 9 Smartlink thanks to the prefabricated cables.

The iMDU auxiliary allows the Reflex iC60 to be controlled in 24/48 V AC/DC.

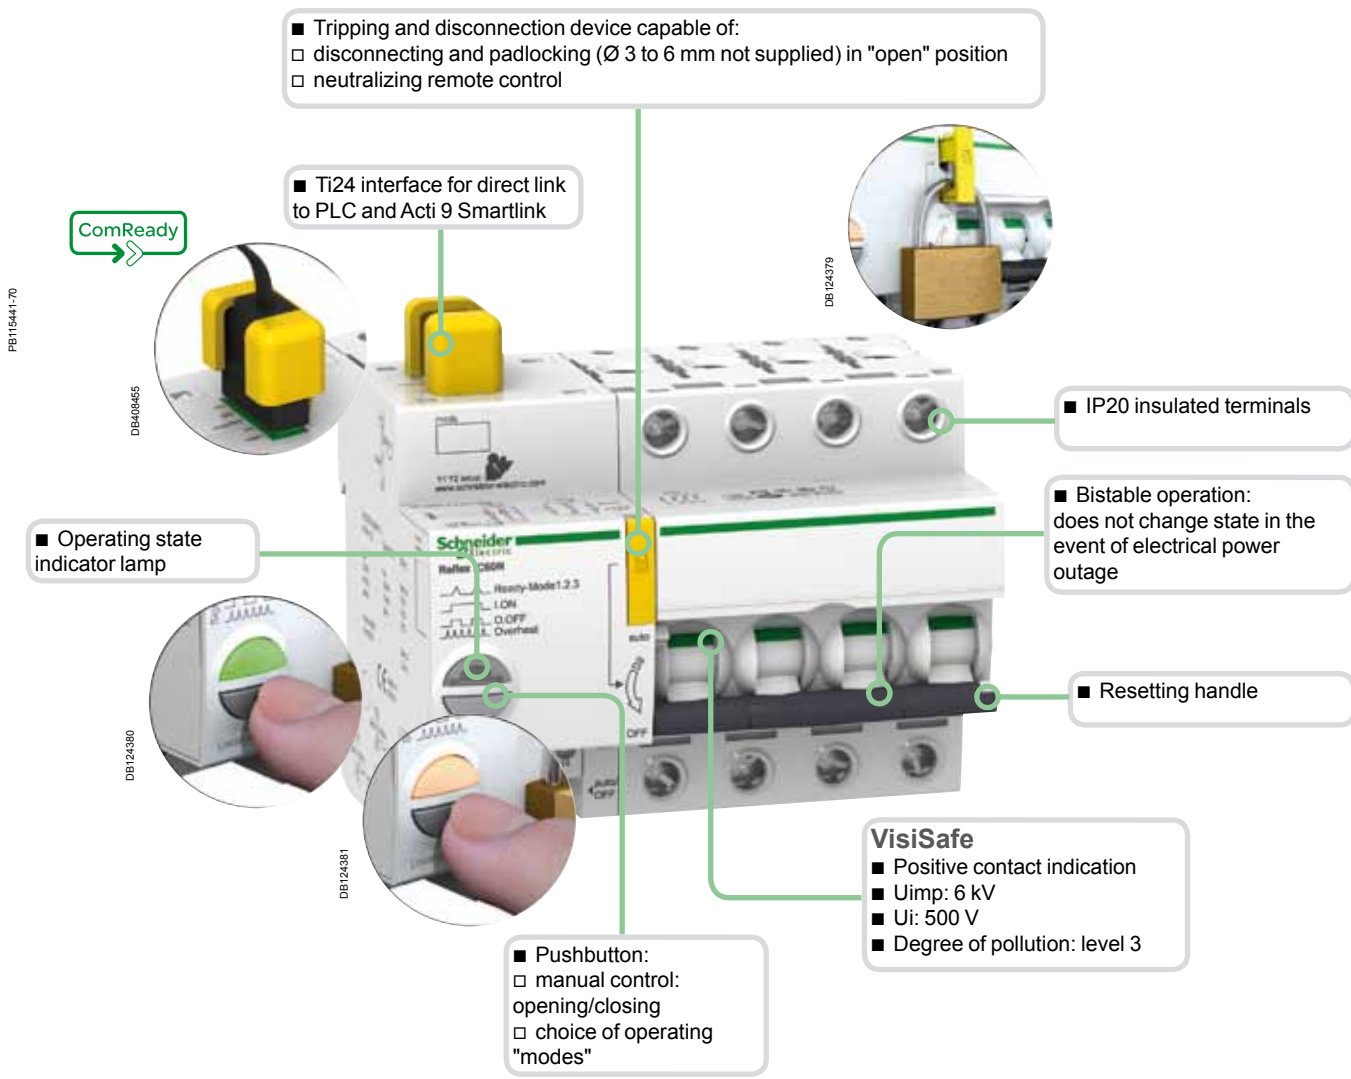

Alternating current (AC) 50/60 Hz

- Longer product service life thanks to:
- good overvoltage withstand capacity: products designed to provide a high industrial performance level (degree of pollution, rated impulse withstand voltage and insulation voltage),
 - high limitation performances,
 - fast closure independent of the speed of resetting of the operating handle.

■ Operating state indicator lamp

■ Pushbutton for:
□ "mode" selection
□ opening/closing manual control

Remote control is possible by 3 operating modes to be set using the pushbutton on the front panel.

Three types of control: Y1, Y2, Y3

Operating modes

Mode 1: Reflex iC60 opening/closing, locally or centrally controlled

- The opening/closing orders come from various control points, and they are taken into account in their order of arrival
- Y1: latched order local control
- Y2: impulse-type local control
- Y3: latched order centralized control

Mode 2: Reflex iC60 opening/closing, possible inhibition of local impulse-type control

- Y1 is used to inhibit Y2
- Y1: local opening/Y2 inhibition latched order control
- Y2: impulse-type local opening/closing control
- Y3: latched order centralized opening/closing control

Mode 3: Reflex iC60 opening/closing, possible inhibition of centralised latched order control

- Y1 is used to inhibit Y3
- Y3 inhibition local latched order control
- Y2: impulse-type local opening/closing control
- Y3: latched order centralized opening/closing control

Pages 444, 445 and 454, 455.

EN 61095, IEC 1095

iCT contactors are available in two versions:

- Contactors without manually-operated
- Contactors with manually-operated.

The breadth of the iCT contactor range satisfies most application cases.
iCT contactors can be combined with auxiliary control, protection and indication functions.

Contactors

iCT 2P

manual control

iCT 4P

- iCT contactors can be used to remote control applications in alternative networks:
 - lighting, heating, ventilation, roller blinds, sanitary hot water
 - mechanical ventilation systems, etc
 - load-shedding of non-priority circuits

Indication iACTs

- This auxiliary allows indication or control of the "open" or "closed" position of the contactor power contacts

Interference filtering iACTp

- This auxiliary is an interference suppressor which limits overvoltages on the control circuit

Dual control iACTc

- Used to control a contactor in impulse-type mode or to combine latched or impulse-type control orders

Control and indication 24 V DC iACT24

- Allows control and indication of a 230 Vac contactor from the Acti 9 Smartlink or by a PLC, by 24 V DC signals
- Also allows control by a maintained signal

Time delay iATEt

- This auxiliary is used to time delay for iCT and iTL. According to cabling, there are 5 possible time delay types:
 - 1 for iTL
 - 4 for iCT

Function type A: late closing
Delay energizing of contactor

Function type B: time delay

- Energize the contactor by closing a push button
- The time delay starts as soon as the control contacts are closed

Function type C: late opening

- Energize the contactor by closing a push button
- The time delay starts when the control contacts are opened

Function type H: fixed time operation

- Operate the contactor for a pre-determined time from the moment of energizing

Technical data

Power circuit		
Voltage rating (Ue)	1P, 2P	250 V AC
	3P, 4P	400 V AC
Frequency	50 Hz or 60 Hz	
Type of load	See module CA908026	
Endurance (O-C)		
Electrical	100,000 cycles	
Maximum number of switching operation a day	100	
Additional characteristics		
Insulation voltage (Ui)	500 V AC	
Pollution degree	2	
Rated impulse withstand voltage (Uimp)	2.5 kV (4 kV for 12/24/48 V AC)	
Degree of protection (IEC 60529)	Device only	IP20
	Device in modular enclosure	IP40
Operating temperature	-5°C to +60°C ⁽¹⁾	
Storage temperature	-40°C to +70°C	
Tropicalization (IEC 60068-1)	Treatment 2 (relative humidity 95 % at 55°C)	
ELSV compliance (Extra Low Safety Voltage) for 12/24/48 V AC versions		
The product control conforms to the SELV (safety extra low voltage) requirements		

(1) In the case of contactor mounting in a enclosure for which the interior temperature is in range between 50°C and 60°C, it is necessary to use a spacer, cat. no. A9A27062, between each contactor

Time delay

PB106125-34

- This auxiliary is used to time delay for iCT and iTL. According to cabling, there are 5 possible time delay types:
- 1 for iTL
- 4 for iCT.

Function type A: late closing

- Delay energizing of contactor.

Function type B: time delay

- Energize the contactor by closing a push button.
- The time delay starts as soon as the control contacts are closed.

Function type C: late opening

- Energize the contactor by closing a push button.
- The time delay starts when the control contacts are opened.

Function type H: fixed time operation

- Operate the contactor for a pre-determined time from the moment of energizing.

- Mounted to the left of iCT by yellow clips⁽¹⁾

iTLs: IEC/EN 60947-5-1

> Impulse relays

PB106128-34

PB106128-34

iTL

- The impulse relays are used to control, by means of pushbuttons, lighting circuits consisting of:
 - incandescent lamps, low-voltage halogen lamps, etc. (resistive loads)
 - fluorescent lamps, discharge lamps, etc. (inductive loads)

> Remote indication

PB106133-34

iTLs

- Allows remote indication of its operating state (open/closed)

PB106139-34

Indication iATLs

- Allows remote indication of the associated impulse relay

> Centralised control

PB106130-34

iTLc

- Allows centralised control of a group of TLc impulse relays, whilst at the same time retaining local impulse-type control

PB106137-34

Centralised control iATLc

- Used for centralised control, thanks to a "pilot line", of a group of impulse relays controlling separate circuit, while at the same time maintaining local individual control of each impulse relay

> Latched control

PB106132-34

iTLm

- Operated by latched orders from a changeover contact (switch, time switch, thermostat). Manual control does not work

PB106138-34

Latched control iATLm

- Controls the associated impulse relay by latched orders from a changeover contact

^ Impulse relays

Impulse relays are used:

- Closing of the impulse relay pole(s) is triggered by an impulse on the coil.
- Having two stable mechanical positions, the pole(s) will be opened by the next impulse. Each impulse received by the coil reverses the position of the pole(s).
- Can be controlled by an unlimited number of pushbuttons.
- Zero energy consumption.

PB106131-34

Changeover contact iTLi

- This impulse relay has a changeover contact

PB106134-34

Extensions iETL

- Used to increase the number of impulse relay poles
- Can be installed on the iTL, iTLi, iTLc, iTLm and iTLs

PB106140-34

Centralised control + indication iATLc+s

- Used for centralised control, thanks to a "pilot line", of a group of impulse relays controlling separate circuit, while at the same time maintaining local individual control of each impulse relay
- Remote indication of the mechanical status of each relay

PB106136-34

Multi-level centralised control iATLc+c

- Allows centralised control of a group of iTLc or "iTL + ATLc" impulse relays

PB107742-34

Control and indication 24 V DC iATL24

- Allows control and indication of a 230 V AC impulse relay from the Acti 9 Smartlink or by a PLC, by 24 V DC signals
- Also allows control by a pulsed signal

ComReady

PB106125-34

Time delay iATEt

- Combined with an impulse relay, it automatically disconnects the circuit after a preset time

PB106141-34

Control iATLz

- Must be used when installing several illuminated PBs in parallel to control an impulse relay (prevents operating malfunctions)

PB106142-63

Step by step control iATL4

- Allows step-by-step control of two circuits via a single pushbutton

(1) The iATLc, iATLs and iATLm 9 mm auxiliaries must be mounted to the right of an impulse relay.

(2) Connection by traditional cabling.

The iATLc+c must be mounted to the right of an iATLc+s or an iATLc.

(3) The centralised control functions (iTLc, iATLc, iATLc+s, iATLc+c) only operate on AC voltage networks.

(4) iATEt: control voltage: 24...240 V AC, 24...110 V DC.

PE100128-41

Yellow clip
 ■ A simple clip-on system for flexible auxiliaries combination and improved robustness
 ■ For electrical and mechanical connections

■ Insulated terminals IP20

■ Large circuit labeling area

■ Consistent with the entire Acti 9 offer and with all types of lighting

■ Disconnection of remote control by selector switch (except for 4P single-piece iTL) for maintenance operation

■ Manual controls on front face: direct and priority manual control by O-I toggle
 ■ Mechanical contact position indicator

■ Built-in or optional auxiliary function: state indication, centralised control, latched control, control for illuminated pushbutton, step-by-step control, time delay

The Schneider Electric range of TL impulse relays comprises various offers (Clario, Prodis, Libro) so as to be as competitive as possible in each country, taking into account the specific features of each market:

- installation customs
- price
- approval by local organizations.

Variants

Offers		Pages
Clario	Catalogue numbers	474
Prodis	Catalogue numbers	475
Libro	Catalogue numbers	476
Common pages		477

Only the product range to be marketed in your country and validated by the local product manager, in agreement with his Final Distribution (FD) partner should be retained. The others will be removed before publication.

IEC 60669-1 and IEC 60669-2-2

TL impulse relays allow remote control of single-phase circuits.

TL impulse relays are combined with single-phase circuit breakers or residual current devices.

Operation

TL impulse relays:

- have normally open contacts
- are controlled by impulse type electrical orders. One or more control points are possible.

The Schneider Electric range of CT contactors comprises various offers (Clario, Prodis, Libro) so as to be as competitive as possible in each country, taking into account the specific features of each market:

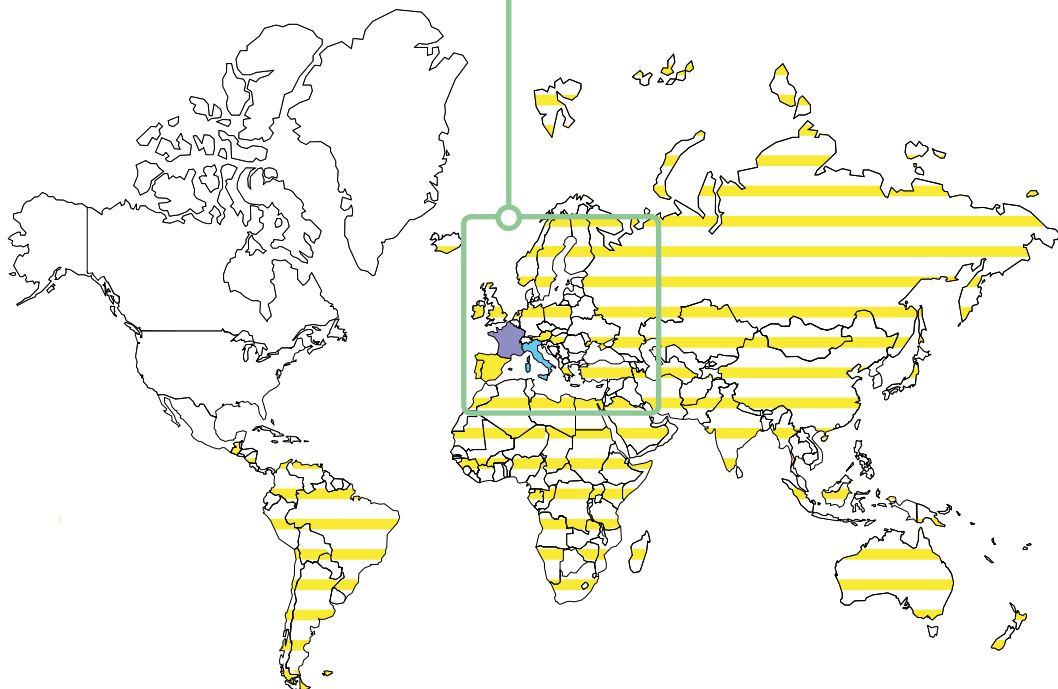

- installation customs
- price
- approval by local organizations.

Variants

Offers		Pages
Clario	Catalogue numbers	480
Prodis	Catalogue numbers	481
Libro	Catalogue numbers	482

■ The staggered terminals facilitate cable connection

■ Every circuit breaker combined with a CT contactor remains compatible with the indication and tripping auxiliaries

Manual-control CT contactors:
 ■ Have a 3-position selector on the front panel:
 automatic operation
 temporary forced starting
 permanent stoppage

■ A connector ensures a fast, reliable electrical connection with the line protection circuit breaker; a branch circuit remains possible at the circuit breaker outlet (e.g. safety lighting power supply). For cabling by wire, the connector can be dismantled

The iTL+ high-performance impulse relay allows remote control of single-phase circuits. It is designed for demanding applications.

EN 60669-2-2

The iTL+ high-performance impulse relay is used for push-button control of lighting circuits consisting of:

- incandescent lamps, low-voltage halogen lamps, etc. (resistive loads)
- fluorescent tubes, discharge lamps, etc. (inductive loads).

iTL+			
Type	Rating		Width in 9 mm modules
1P+N	16 A	A9C15032	2+1 ⁽¹⁾

(1) Supplied with a 9 mm spacer (cat. no. A9N27062): to be used for mounting the iTL+ alongside a circuit breaker, contactor, impulse relay, etc., in order to maintain optimal operation.

- It is compulsory:**
- to connect the neutral
 - to keep the same control circuit connection "A1: phase", "A2: neutral"
 - to use the same phase for connection of the power and control functions.

Operation

	20 A	1 NO	A9C15030	2+1 ⁽¹⁾
1P+N with manual control				
	20 A	1 NO	A9C15031	2+1 ⁽¹⁾

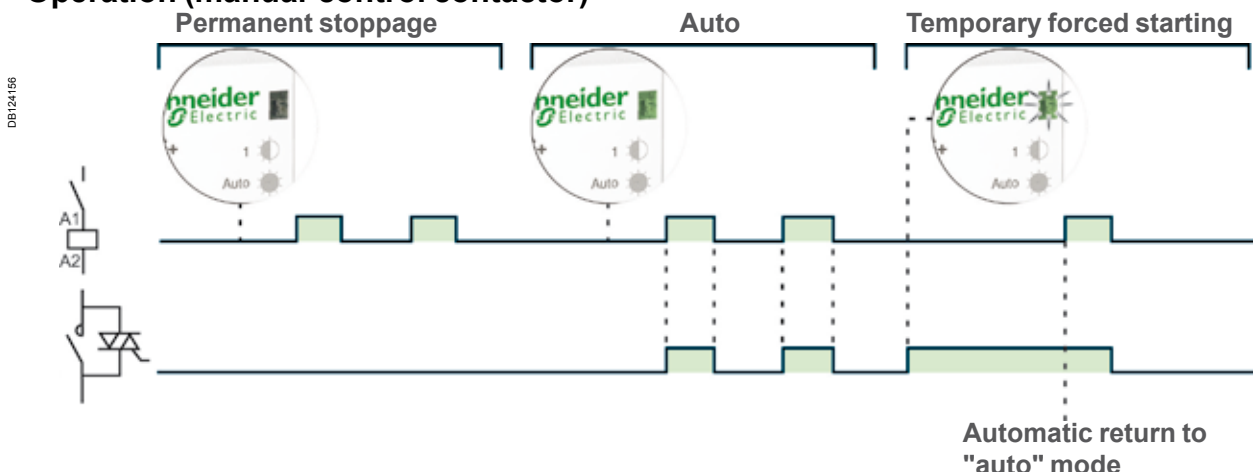

(1) Supplied with a 9 mm spacer (cat. no. A9N27062): to be used for mounting the iCT+ alongside a circuit breaker, contactor, impulse relay, etc., in order to maintain optimal operation.

It is compulsory:

- to connect the neutral
- to keep the same control circuit connection "A1: phase", "A2: neutral"
- to use the same phase for connection of the power and control functions.

Operation (manual-control contactor)

iCT+ high-performance contactors (cont.)

They combine the benefits of static switching and electromechanical technology: small size, little temperature rise.

■ Silent
■ Large number of switching operations

■ Operating mode selection push button:
□ auto operation
□ temporary forced starting*
□ permanent stoppage

■ Equivalent performances with all types of lamps
■ No derating

■ Green indicator on the front panel:
□ fixed green: auto operation
□ flashing green: temporary forced starting
□ extinguished: permanent stoppage

■ Orange indicator: output contact closed

Following a mains failure, the iCT+ returns to "auto" operating mode irrespective of its initial state.

Bell transformers: EN/IEC 61558-2-8.

Safety transformers: EN/IEC 61558-2-6.

Bell transformers and safety transformers allow for a very low voltage (ELV 8 V, 12 V or 24 V) to be obtained from a low voltage network (LV 230 V).

All Schneider Electric transformers are:

- Safe: primary and secondary circuits are perfectly insulated by each other
- Resistant to short-circuit currents thanks to the built-in device
- Class II with terminal shield (optional).

CDS, CDSc : NF C 61.750, EN 500 81.1

When consumption exceeds the selected threshold, the load-shedder temporarily cuts off the power supply to non-priority circuits.

Load-shedders are used to:

- increase the number of loads without modifying the installed power
- reduce the installed power
- prevent nuisance tripping of the upstream circuit breaker.

Load-shedders

PB110008-34

Single-phase DSE1

- Load-shedding and restoration of 1 non-priority channel
- Tripping threshold adjustable from 0.8 kW to 7 kW (by default: 3.7 kW)
- Pre-alarm time before load-shedding (Ton) adjustable from 0 s to 9999 s (by default: 60 s)
- Load-shedding time (Toff) adjustable from 0 s to 9999 s (by default: 120 s)
- Buzzer operating time (Tbe) adjustable from 1 s to 9999 s (by default: 60 s)
- Backlit LCD display, 3 digits after the decimal point

PB107189-34

Single-phase CDS

- Load-shedding and restoration in cascading configuration of 2 non-priority circuits via 2 relays with time-delayed action:
 - load-shedding of circuit 1 only: load restoration after 5 min
 - load-shedding of circuit 1 and circuit 2:
 - load restoration of circuit 2: after 10 min
 - load restoration of circuit 1: 5 min. after circuit 2

PB107190-36

Three-phase CDS

- Load-shedding and restoration separately phase by phase
- 1 relay per phase
- Load-shedding time: 5 min. for each channel

PB107188-36

Single-phase CDSc

- Load-shedding and restoration in cascading configuration, then 1 to 4 non-priority circuits successively in turn
- Cyclic load-shedding: changing the order every 5 min.

Dimensions (mm)

Installation

⚠ Use a contactor for any load-shedding above 16 A.
Designed for load-shedding household equipment circuits, except lighting circuits.
The load is restored without pre-indication.

DSE1

DB4048Z1

- (1) Determine the circuit-breaker rating according to the cable cross-section.
- (2) Calculate the contactor rating according to the load power.

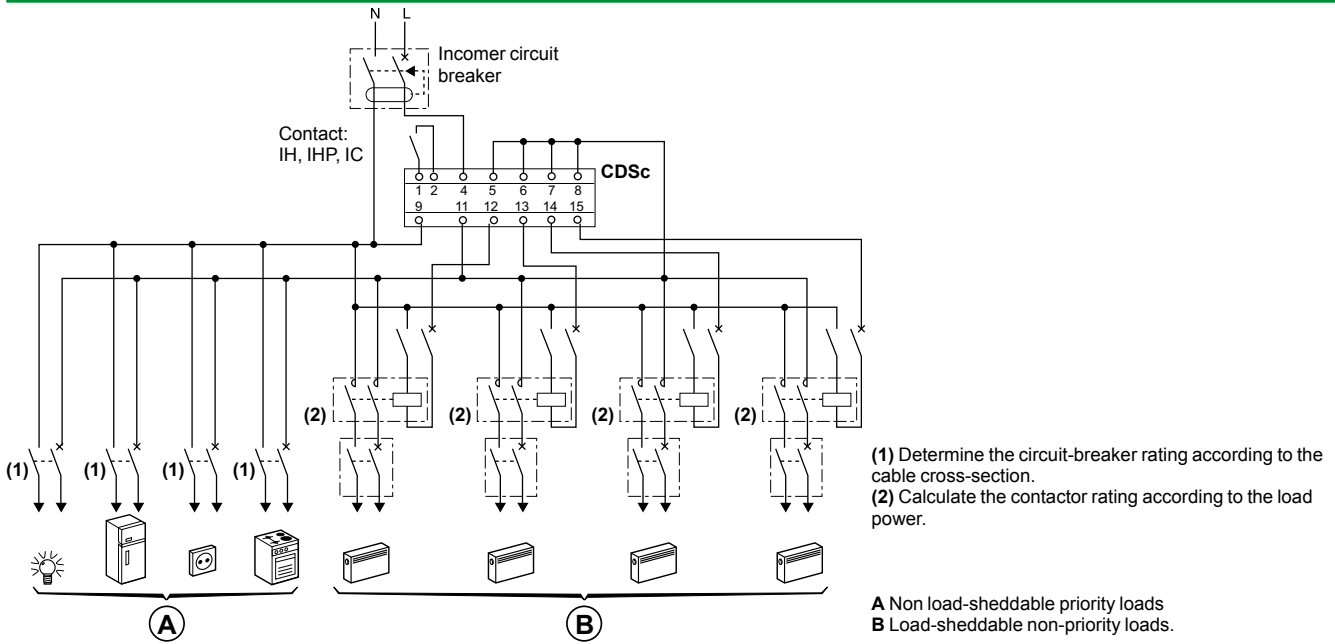

- A** Non load-sheddable priority loads.
- B** Load-sheddable non-priority loads >16 A (relaying by contactor).
- C** Load-sheddable non-priority loads < 16 A.

Installation (cont.)

⚠ Non-priority outputs must not be connected directly: they must be relayed by means of contactors.
Do not shed circuit loads that include machine and lighting type applications.

Specific technical data

IC2000P+

External input

Voltage rating (Ue)	230 V AC, +10 %, -15 %
Frequency	50/60 Hz
Input current	≤ 2.5 mA
Consumption	≤ 0.4 mW
Cable length	≤ 100 m

IC Astro

Programming longitude	-180° (East) to +180° (West) in steps of 1°
Programming latitude	-90° (South) to +90° (North) in steps of 1°

IC100kp+, IC Astro

Programming accessories	<ul style="list-style-type: none">■ Programming kit for PC consists of a programming device, a memory key, a CDROM and a 2 m USB cable■ Memory key for saving and duplicating programs, delivered on front face
-------------------------	--

External inputs

External inputs for external control with a standard switch or a push-button	<ul style="list-style-type: none">■ 1 input "Ext" for 1 channel versions■ 2 inputs "Ext1" and "Ext2" for 2 channels versions
Voltage rating (Ue)	<ul style="list-style-type: none">■ 230 V AC, +10 %, -15 % for 1 channel versions■ 100-240 V AC +10 %, -15 % for 2 channels versions
Frequency	50/60 Hz
Input current	≤ 0.5 mA
Consumption	≤ 130 mW
Cable length	≤ 100 m

IC2000P+

The IC 2000P+ uses its time programming to define lighting On and Off periods:

- According to three pre-set time programs:
 - "DAYPROG": On time programming from 7 am to 8 pm a validation of the IC function from 7 am to 8 pm,
 - "NIGHTPROG": On time programming from 5 am to 8 am and from 6 pm to 11 pm a validation of the IC function on these two operating periods,
 - "EMPTYPROG": Off time programming throughout the day a no validation of the IC function. These programs can be modified if necessary.
- According to a customised operating period, with possibility of copying to the other days. It is equipped with the following functions:
 - consideration of periods of absence (holidays),
 - temporary or permanent On or Off override,
 - remote control of lighting override by NO external contact,
 - consideration of change to "summer/winter" time, automatic or manual,
 - permanent liquid crystal display: of time and minutes, of day of the week, of the contact output status and current program.

Example

Lighting of a shop window, in the evening, at a time variable according to brightness and switch-off at a set time (e.g. 11 pm). Then in the morning, lighting at a set time (e.g. 4 am) and switch-off at a time variable according to brightness (see Fig. 1).

Configuration

This consists of recording in the memory:

- The language.
- The year, month, day and time.
- One of the 3 pre-set programs:
 - "DAYPROG": "On" time programming from 7 am to 8 pm → validation of the IC function from 7 am to 8 pm,
 - "NIGHTPROG": "On" time programming from 5 am to 8 am and from 6 pm to 11 pm → validation of the IC function on these two operating periods,
 - "EMPTYPROG": "Off" time programming throughout the day → no validation of the IC function. These programs can be modified.
- The brightness threshold. Once this phase is over, your IC 2000P+ operates in AUTO mode according to the items you have chosen.

Programming

The IC2000P+ is used to manage time programs. It allows:

- Creation of a new program with the possibility of copying to the other days.
- Viewing programs in memory.
- Modification of a program in memory, of the time, date, summer/winter time.
- Partial or total deletion of the program (date, time and language are kept).
- Modification of the brightness threshold.
- Separate setting of the time delay on switch-on and switch-off.

Move to On/Off override

- Press briefly (< 2 s) and simultaneously the 2 keys "-", "+" (value setting and navigation keys) on the front face to move to "MAN ON" or "MAN OFF".
 - Press the keys for more than 2 s to move to "PERM ON" or "PERM OFF".
 - Supply of terminal 1 overrides the IC 2000P+ output to the "On" position.
- This external override takes priority over the product On/Off override function (see Fig. 2, 3).

Fig. 1.

Fig. 2.

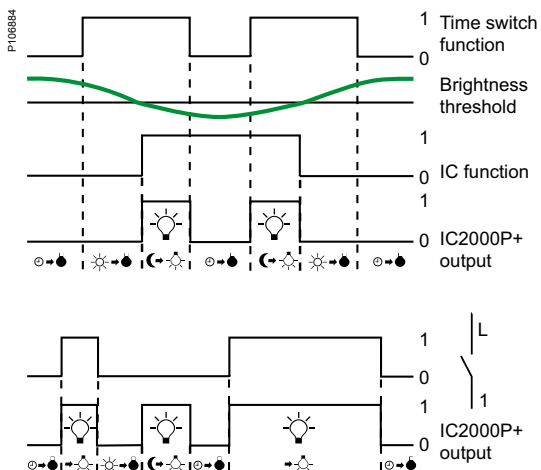

Fig. 3.

IC Astro

The IC Astro is configured according to the place of installation.

- The place of installation of the IC Astro can be configured:
 - either by selecting a country and a town,
 - or by its geographic coordinates (latitude, longitude).
- The IC Astro allows:
 - addition or deletion of a switch-off/switch-on switching operation (Off-On) between the sunset and sunrise times,
 - different programmes each day,
 - difference in sunset and/or sunrise times, adjustable separately by ± 120 min. according to local constraints (mountains, buildings, etc.),
 - consideration of periods of absence (holidays),
 - remote control of lighting override by external standard switch or push-button via the external input (1 external input per channel),
 - re-initialisation of programmes,
 - automatic switching to "summer-winter" time,
 - permanent display by liquid crystals: hours and minutes, day of the week, contact output status, and current programme,
 - manual waiver of the lighting On/Off programme, permanently or temporarily (up to the next switching operation).
 - back-lighting of the screen.

Fig. 3.

Fig. 4.

Fig. 5.

Fig. 6.

Example

Automatically lighting On and Off a shop window in Paris according to sunset and sunrise, example the 20th June.

- At night (10 pm) the lighting switch-on.
- At the morning (6 am) the lighting switch-off.

Configuration

This consists of writing in the memory:

- The language.
- The place of installation, either:
 - by its position (Argentina, China, etc.) and by the closest town,
 - by its geographic coordinates (latitude, longitude, time difference with respect to GMT) (a map is provided with the product).
- The year, month, day and time.
- Once this phase is complete, IC Astro will calculate the sunrise and sunset times and propose a default programme (operation from sunset to sunrise) (see Fig. 3).

Programming an Off period

The IC Astro offers the possibility of adding an "Off" period (programmed switch-off and switch-on) inside the programme, between the sunrise and sunset times (by default it is proposed from 11 pm to 5 am) (see Fig. 4).

Modifying programming and configuration

The twilight switch allows:

- Creation of a new customised programme with possibility of copying onto the other days.
- Display of programmes in memory.
- Deletion, modification or addition of an automatic or programmed switching operation.
- Partial or total deletion of the programme (date, time and language are kept).
- Modification of time, date, summer/winter time.
- Temporary cancellation of the "On" periods by configuring start and end dates and Times of absence (holidays).
- Adjustment of difference in sunset and/or sunrise times by ± 120 min. according to local constraints (mountains, buildings, etc.) (see Fig. 5).

Move to On/Off override

- Briefly press (<2 s) at the same time on the 2 keys "-", "+": (value setting and navigation keys) on the front face to move to "ON TEMP" or "OFF TEMP".
- Hold down (>2 s) the keys to move to "ON PERM" or "OFF PERM".
- The supply of input 5 forces the IC Astro output to the "ON" position. This override takes priority over the product On/Off override function (see Fig. 6).

Connection

Type	Tightening torque	Copper cables	
		Rigid	Flexible or with ferrule
IC100, IC2000P+	1.2 N.m	DB122346 ≤ 6 mm ²	DB123553 ≤ 6 mm ²
IC2000, IC Astro, IC100kp+	2 screwless / pole	2 x 2.5 mm ²	2 x 2.5 mm ²

IC100, IC Astro are mechanical compatible with electrical distribution comb busbar.

Weight (g)

Twilight switches	1C	2C
IC100	173	
IC2000	280	
IC2000P+	323

Dimensions (mm)

Cells

Standard switchboard cell (15281) Fixed externally in vertical position by 2 ø 4 mm screws

Digital switchboard cell (CCT15261)

Wall-mounted cell (delivered with IC100, IC2000P+)

Standard and digital wall-mounted cell (CCT15268, CCT15260)

> Time switches

> The 36 and 45 mm digital time switches

IHP 1c **IHP 2c** **IHP+1c** **IHP+2c**

Automatically switch On and Off loads according to the program entered by the user with 4 keys and a display, they operate on a weekly cycle: the same program is repeated week after week.

IHP+ DCF 1c + DCF77 antenna
Synchronised on the frankfort transmitter via the DCF77 antenna.

> The 18 mm digital time switches

IHP 1c/+ 1c

Automatically switch On and Off loads according to the program entered by the user with 4 keys and a display, they operate on a weekly cycle: the same program is repeated week after week.

> The 54 mm mechanical time switches

IH 60mn 1c SRM **IH 24h 1c SRM/ ARM** **IH 24h 2c ARM**

IH 24h + 7j 1+1c ARM **IH 7j 1c ARM**

Automatically switch On and Off loads according to the program entered by the user they operate on an hourly, daily or weekly cycle: the same program is repeated hour after hour (IH 60mn), day after day (IH 24h) or week after week (IH 7j).

> The 18 mm mechanical time switches

IH 24h 1c SRM/ ARM **IHH 7j 1c ARM**

Automatically switch On and Off loads according to the program entered by the user they operate daily on a weekly cycle.

> The digital yearly time switches

ITA 1C **ITA 4C**

They operate on an daily, weekly or yearly program (ITA 1c: 1 channel, ITA 4c: 1, 2, 3 or 4 channels - 2 external inputs).

Selection table

The time switches control opening and closing of one or more separate circuits according to a programming pre-set by the user:

- by memorisation of On and Off switching operations for the IHP and ITA digital time switches
- by positioning of jumpers or captive segments on a programming dial for the IH mechanical time switches.

An IHP, IH or ITA time switch is chosen according to the following criteria:

Designation	Number of channels	Cycle period (d: day)	Minimum time between 2 switching operations	Number of switching operations	Saving on mains cut off	Width (modules of 9 mm)	Override controls On / Off	Output contact changeover switch (cos φ =1)	Time changeover (summer / winter)
The 36 or 45 mm digital time switches									
IHP 1c	1	24 h and/or 7 d	1 min.	56	6 years	5	On / Off	16 A	Auto

Specific technical data

IHP+ 1c, IHP+ 2c, IHP+ DCF 1c	
Manual functions	Temporary cancellation of programming for holidays, public holidays, etc. by configuration of the 2 dates - start and end of absence Simulation of presence thanks to random operation during On periods
Pulse functions	Programming of pulses adjustable from 1 to 59 s (pulse takes priority over switching)
Back-lighting of the screen	
External input (only for IHP+ 1c, IHP+ 2c)	
External inputs for external control with a standard switch or a push-button	1 input for IHP+ 1c 2 inputs for IHP+ 2c
Voltage rating (Ue)	230 V AC, +10 %, -15 %
Frequency	50/60 Hz
Input current	≤ 1.2 mA
Consumption	≤ 0.3 mW
Cable length	≤ 100 m
(2) The ITA 1c and ITA 4c can be synchronised on the Frankfurt 's DCF77 radio station via the DCF or GPS antenna	
Automatic on commissioning, then at 1 am, 2 am, 3 am and 4 am every day	
Manual by pressing the IHP or ITA keys or after a "reset"	
Displayed on the screen by the letters RC	
Programming of pulses adjustable from 1 to 59 s (pulse takes priority over switching)

Output	Protocole DCF	DCF time telegraph (no weather data)
Receiver	Narrowband-heterodyne receiver	–
Operation indicator	Flashing LED on receiving	Flashing LED on receiving

Programming principle

- For the digital time switches, this consists of memorising the days and times of the required switching operations.
- For the mechanical time switches, this is performed by positioning captive segments or jumpers on a switching dial.

Example

- Controlling an air conditioner in a hairdressing salon:

	Monday ⁽¹⁾	Tuesday	Wednesday	Thursday ⁽²⁾	Etc.	
On n° 1		08 h 30	08 h 30	08 h 30		Switch on
Off n° 1		12 h 00	12 h 00			Switch off
On n° 2		13 h 30	13 h 30			Switch on
Off n° 2		20 h 00	20 h 00	20 h 00		Switch off

⁽¹⁾ Closed on Mondays

⁽²⁾ Non-stop

Programming by copying or blocks

Whenever identical switching operations are found at the same times, several days in the week, this function lets you program these operations once only. In this case a single switching operation is used. If this function is used wisely, the number of possible switching operations can be greatly increased.

Example

	Monday	Tuesday	Wednesday	Thursday	Friday	
On n°1	10 h 00			10 h 00		Switch on
Off n°1		18 h 00	18 h 00		18 h 00	Switch off

Number of switching operations

Designation	Number of switching operations
IHP 1c	56
IHP + 1c	84
IHP+ DCF 1c	84
IHP 2c	56
IHP + 2c	84
IHP 1c 18 mm	56
IHP + 1c 18 mm	84
ITA 1c, ITA 4c	300
IH 24h 1c ARM	48 On - 48 Off
IH 24h 1c SRM	48 On - 48 Off
IH 60mn 1c SRM	48 On - 48 Off
IH 24h 1c SRM	48 On - 48 Off
IH 24h 1c ARM	48 On - 48 Off
IH 24h 2c ARM	24 On - 24 Off
IH 7j 1c ARM	42 On - 42 Off
IH 24 h + 7j 1+1c ARM	16 On - 16 Off + 7 On - 7 Off

Saving on mains cut off

For digital switches equipped with this function, a lithium battery is used for saving. The program, date and time are preserved. Switching operations are not performed.

Lets you control starting and stopping of a group of loads according to a cycle that is repeated every 60 minutes.

60 min. time programming

Example

Controlling automatic watering	
On n° 1	2 min. 30 s
Off n° 1	5 min.
On n° 2	25 min.
Off n° 2	37 min. 30 s

Relevant time switches

IH 60mn 1c SRM.

Lets you control starting and stopping of one or two groups of loads according to a daily cycle that is repeated, in identical manner, every day of the week.

24 h daily programming

Example

- Controlling a door of a block of flats:
 - from 8 am to 7.30 pm: contact on "On", free access,
 - from 7.30 pm to 8 am the next day: contact on "Off", access by confidential code every day of the week:

	From Monday to Sunday
On n° 1	8 am
Off n° 1	7.30 pm

Relevant time switches

- IH 24h 1c SRM/ARM.
- IH 24h 2c ARM.
- IHP 1c 18 mm.
- IHP + 1c 18 mm.
- IHP+ DCF 1c.
- IHP 1c, IHP + 1c.
- IHP 2c, IHP + 2c.
- ITA 1c, ITA 4c.

Lets you control starting and stopping of one to 4 groups of loads according to a weekly cycle, that can be different each day, repeated each week.

7 days weekly programming

Example

- Controlling an air conditioner in a hairdressing salon:

	Monday	Tuesday	Wednesday	Thursday	Friday	Saturday	Sunday
On n° 1			09 h 00	09 h 00	09 h 00		
Off n° 1			12 h 00	12 h 00			
On n° 2			14 h 00	14 h 00			
Off n° 2			20 h 00	20 h 00	20 h 00		
On n° 3						8 h 30	8 h 30
Off n° 3						12 h 30	12 h 30
On n° 4						14 h 30	14 h 30
Off n° 4						21 h 00	21 h 00

Relevant time switches

- IH 7j 1c ARM.
- IHP 1c, IHP + 1c.
- IHP 2c, IHP + 2c.
- IHP 1c 18 mm.
- IHP + 1c 18 mm.
- IHP+ DCF 1c.
- ITA 1c, ITA 4c.

Lets you control by pulses (adjustable from 1 to 59 s) one to four groups of loads (pulse relays, bells, etc.).

Pulse programming

Example

■ Automatic controlling of bells, lighting and distribution of food: bells sounding the resumption and finish of work (channel 1), lighting of premises (channel 2), feeding fish in the aquarium (channel 3):

	Monday	Tuesday	Wednesday	Thursday	Friday	Saturday	Sunday
Channel 1: bell (20 s pulse order)							
On	08 h 00	08 h 00	08 h 00	08 h 00	07 h 00	09 h 00	–
Duration	20 s	20 s	20 s	20 s	20 s	20 s	–
On	12 h 00	12 h 00	12 h 00	12 h 00	11 h 00	13 h 00	–
Duration	20 s	20 s	20 s	20 s	20 s	20 s	–
On	14 h 00	14 h 00	14 h 00	14 h 00	13 h 00	–	–
Duration	20 s	20 s	20 s	20 s	20 s	–	–
On	18 h 00	18 h 00	18 h 00	18 h 00	16 h 00	–	–
Duration	20 s	20 s	20 s	20 s	20 s	–	–
Channel 2: lighting (latched order)							
On	07 h 30	07 h 30	07 h 30	07 h 30	06 h 30	08 h 30	–
Off	18 h 30	18 h 30	18 h 30	18 h 30	17 h 00	13 h 30	–
Channel 3: aquarium (15 s pulse order)							
On	10 h 00	–	10 h 00	–	10 h 00	–	10 h 00
Duration	15 s	–	15 s	–	15 s	–	15 s

Programming

- Programming of a pulse takes up 2 memory spaces.
- Combination of the two order types (pulse and latched) is possible on the same channel.

Relevant time switches

- IHP + 1c.
- IHP + 1c 18 mm.
- IHP+ DCF 1c.
- IHP + 2c.
- ITA 1c, ITA 4c.

Lets you create special programs for dated days.

Programming special days.

Example

- Controlling lighting and heating in a school:
- basic programming: program lighting (channel 1) and heating (channel 2):

	Monday	Tuesday	Wednesday	Thursday	Friday	Saturday	Sunday
Channel 1: lighting							
On	07 h 00	07 h 00	07 h 00	07 h 00	07 h 00	–	–
Off	20 h 00	20 h 00	16 h 00	20 h 00	16 h 00	–	–
Channel 2: heating							
On	06 h 00	06 h 00	06 h 00	06 h 00	06 h 00	–	–
Off	18 h 00	18 h 00	12 h 00	18 h 00	12 h 00	–	–

- dated programming: periods of non-operation, school holidays, etc.
- Just memorise an Off at the start and another Off at the end of each period of absence:

		Holidays				
		Winter	Spring	Summer	Autumn	End of year
Channel 1: lighting						
Off	Date	20 feb.	17-apr	07-july	23 oct.	18 dec.
	Time	12 h 00	17 h 00	12 h 00	17 h 00	12 h 00
Off	Date	08-march	03-may	9 sept.	2 nov.	4 jan.
	Time	01 h 00	01 h 00	01 h 00	01 h 00	01 h 00
Channel 2: heating						
Off	Date	20 feb.	17-apr		23 oct.	18 dec.
	Time	12 h 00	17 h 00		17 h 00	12 h 00
Off	Date	08-march	03-may		2 nov.	4 jan.
	Time	01 h 00	01 h 00		01 h 00	01 h 00

Relevant time switches

- ITA 1c, ITA 4c.

Load table

Type of lighting (230 V AC)	Max. power (for higher power, relay with a contactor)

STD400LED+

STD

- The STD dimmers modulate incandescent halogen, lighting brightness and motors for unit powers from 40 to 1000 W from one or more switch-on points.
- They can be controlled either with the local control push-button placed on front panel or with auxiliary push-buttons.
- They have soft-On / soft-Off, light level memory and minimum level setting features.
- They are available in 2 different types:
 - DIN type (STD400RC/RL-DIN, STD1000RL-DIN) supplied without digital inputs,
 - SAE type (STD400RC/RL-SAE, STD1000RL-SAE) supplied with 4 digital inputs.

STD LED

- The STD LED dimmers switch and dim the lighting brightness of:
 - incandescent lamps, halogen lamps, (conventional or with electronic transformer),
 - dimmable lamps: fluocompact and LED 230 V.
- The brightness is set via the push buttons connected to the dimmer.
- They have soft-On / soft-Off, light level memory and minimum level setting features.
- The STD LED+ could be used with a movement detector, a presence detector or a programmable time switch. It also provides a staircase function incl. pre-warning.

SCU

P112221-36

SCU10-SAE

SCU

- The SCU dimmers modulate fluorescent lighting brightness for unit powers from 40 to 1500 W from one or more switch-on points.
- They can be controlled either with the local control push-button placed on front panel or with auxiliary push-buttons.
- They have soft-On / soft-Off, light level memory and minimum level setting features.
- They are available in 2 different types:
 - DIN type (SCU10-DIN) supplied without digital inputs,
 - SAE type (SCU10-SAE) supplied with 4 digital inputs.

Specific technical data

SAE types									
Input voltage	12- 30 V AC/DC								
The STD400RC/RL-SAE , STD1000RL-SAE and SCU10-SAE dimmers are supplied with 4 digital inputs	<table border="1"> <tr> <td>Input 1</td> <td>On/Off and dimming up/down or only On and dimming up (depends on function mode)</td> </tr> <tr> <td>Input 2</td> <td>Off and dimming down or only Off (depends on function mode)</td> </tr> <tr> <td>Input 3</td> <td>Adjustable lighting level memory 1 (50 % default)</td> </tr> <tr> <td>Input 4</td> <td>Adjustable lighting level memory 2 (100 % default)</td> </tr> </table>	Input 1	On/Off and dimming up/down or only On and dimming up (depends on function mode)	Input 2	Off and dimming down or only Off (depends on function mode)	Input 3	Adjustable lighting level memory 1 (50 % default)	Input 4	Adjustable lighting level memory 2 (100 % default)
Input 1	On/Off and dimming up/down or only On and dimming up (depends on function mode)								
Input 2	Off and dimming down or only Off (depends on function mode)								
Input 3	Adjustable lighting level memory 1 (50 % default)								
Input 4	Adjustable lighting level memory 2 (100 % default)								
Max wire length	50 m								
Up to 25 push-buttons per input. No push-button with indication lamp									
STD400RC/RL-DIN and STD400RC/RL-SAE dimmers are power regulators designed for all dimmable load types. Dimmers have automatic load type detection and the load regulation method is adjusted to fit the load									

Operation modes for SAE types

- **STD400RC/RL-SAE**, **STD1000RL-SAE** and **SCU10-SAE** dimmers have 2 different operation modes (**A** and **B**) using auxiliary push-buttons connected on digital inputs (1, 2, 3 and 4 terminals).
- Modes **A** and **B** can be changed by pushing the digital inputs 3 and 4 simultaneously for 10 s. After the mode is changed the load and the LED start to blink as long as the inputs are pushed.
- In the mode **A**, the input 1 dims the lights on with a short push and up with a long push and turns light off with a short push and dims the light down with a long push. The direction is changed every time the input 1 is released. The input 2 dims the lights always off.
- In the mode **B**, the input 1 dims lights only up with a long push and turns lights on with a short push. The input 2 dims the lights only down with a long push and turns lights off with a short push.
- Inputs 3 and 4 are for memory places for light levels. The light level is called with a short push and set into the memory with a long push of 3 s.

Common technical data

Common operation mode for SAE & DIN types

- The dimmer is turned On/Off by shortly pushing the front panel push-button. This push-button lights blue when the dimmer is On.
- The light level is controlled by keeping the front panel push-button pushed until wanted level has been reached.
- The direction of dimming (up/down) is changed every time the front panel push-button is released.
- The dimmer has memory function which stores the light level before Off-command. When the dimmer is turned back On, the light level is the same as it was before Off-command.
- Auxiliary push-buttons connected on  terminal have the same functionality as the push-button on the front panel of the dimmer.

Programmable thermostat

THP1+ 1C

DB-406875

- The THP1+ 1C programmable thermostat controls the operating periods of all heating types by monitoring and regulating ambient temperature between 10°C and 30°C, using a programme pre-set by the user and memorised
- The THP1+ 1C monitors and regulates temperature in a room by comparing the value of the temperature measured by the ambient temperature probe with the value of the setpoint displayed on its front face according to 3 operating modes:
 - comfort: 10°C to 30°C while the premises are occupied
 - reduced: 10°C to 26°C while the premises are unoccupied
 - above freezing: the temperature in the premises is maintained at approximately 10°C
- The THP1+ 1C, can control the following loads:
 - convectors
 - a burner
 - a "hot air" heating system
 - heating valves: hydraulic, electromagnetic or electrothermal

DB-406879

An ambient temperature probe needs to be ordered separately (see next page ref. 15835 or 15836)

Temperature probes

Accessories	Floor temperature probe (with 1.5 m cable)	Ambient temperature probe (with 1.5 m cable)
Type		
Installation		
Mounting	<p>This probe must be placed:</p> <ul style="list-style-type: none"> ■ in a Ø 9 mm tube, embedded in the slab in the middle of a turn ■ one of the ends must run out of a distribution box sealed in the nearest wall (to simplify probe installation or replacement) 	<p>This probe must be fixed 1.50 m above the floor, away from drafts and sources of heat (sun's rays, radiators, machines, etc.)</p>
Catalogue numbers	CCT15845	CCT15846

Note: for all probes, do not run connecting cables alongside power cables.
 TH4 and TH7 probes cables can be extended up to 70 m by using 6/10th telephone cable or up to 150 m by using shielded copper cable.
 THP1+ 1C probes cables can be extended up to 50 m by using 6/10th telephone cable or shielded copper cable.

Specific technical data

TH4		
Settings	Comfort	From +8°C to +26°C
	Reduced	From 0°C to 10°C below the selected "comfort" temperature set point: control (manual or automatic) by external dry contact
	Above freezing	Maintains room temperature according to a factory adjusted temperature set point of +5°C: control (manual or automatic) by external dry contact
Three indicator lights visualise	Green	Above freezing operation
	Yellow	Reduced operation
	Red	Relay: ON
Delivered with ambient temperature probe (CCT15846)		NTC 10 kΩ (25°C) can be extended up to 150 m with shielded copper cable and up to 70 m with telephone cable
Note: however, the set point selected never can't be less than +8°C. Eg. If the reduced set point is selected with a 12°C set point temperature and a 10°C reduction temperature, the operative set point will not be +2°C (12-10) but rather +8°C (+5°C only if the "above freezing" input is closed/active).		
TH7		
Temperature set point settings ⁽¹⁾	Range	6 fixed positions: -40°C, -20°C, 0°C, +20°C, +40°C and +60°C
	Adjustements	From 0°C to 20°C above the selected fixed position
Indicator light	Red	Relay: ON
Delivered without probe		

(1) For example: if "range" is on -40°C, setting is possible between -40°C and -20°C.

THP1+ 1C programming

A programmable clock, built into the THP1+ 1C, is used for programming (see Fig. 4).

- The various operations for updating time and day.
- Programming possibilities:
 - 24 hours and 7 days: a separate programme for each day of the week,
 - up to 42 switching operations memorised,
 - the same switching operation used over several days only counts as one switching operation,
 - Power reserve: 10 years.

Example

- Programming:
 - temperature thresholds: "comfort" 19°C and "reduced" 16°C,
 - presence from 6 a.m. to 8 a.m. and from 6 p.m. to 11 p.m.: "comfort" heating, temperature of 19°C,
 - absence (from 8 a.m. to 6 p.m.) and nighttime (from 11 p.m. to 6 a.m.): "reduced" heating, temperature of 16°C.

Fig. 5. THP1+ 1C connection example.

Local control

The configuration interface of the THP1+ 1C programmable thermostat consists of a screen and four configuration buttons.

The THP1+ 1C programmable thermostat has a built-in clock and its main menu is used to:

- set the temperatures: "comfort", "reduced" or "frost protection",
- assign these temperatures to a maximum of 42 hourly switching operations over 7 days,
- set the date and time format, the transition to summer or winter time,
- manually override the temperature without changing the hourly switching operations if the premises are not used during holidays, etc.

The option menu can be accessed to set:

- the external input (deactivated, "comfort", "reduced" or "frost protection" temperature),
- the type of heating:
 - heater, convector (NORMAL),
 - inertia heating (UNDERFLOOR),
 - pulsed-air heating (AIR HEATING),
- the temperature compensation to correct the measurement obtained by the temperature probe in the event of an unfavourable location,
- the screen lighting mode:
 - constantly on,
 - off after 1 minute,
- the language used,
- and to reset the parameters (return to factory settings).

Compatibility of 50/60 Hz equipment with a 400 Hz network

The performance of products designed for domestic frequencies of 50/60 Hz is impacted by the specific properties of networks of 400 Hz frequency.

Phenomena due to the increased frequency influence the behaviour of the copper components of transformers, cables and protective equipment.

Some types of equipment designed for 50/60 Hz networks may not be suitable. You should check whether or not a product is compatible, and also apply any correction factors given by the manufacturer.

Circuit breakers

Depending on the technologies used, modular circuit breakers designed for 50/60 Hz can be used at 400 Hz.

To choose the performance of a modular circuit breaker:

- do not take any thermal derating into account (In at 400 Hz is equivalent to In at 50 Hz).
- increase the magnetic tripping threshold, according to the table below.
- check that the short-circuit current on the installation is less than the breaking capacity of the circuit breaker. The breaking capacity of the circuit breakers at a frequency of 400 Hz is the same as at frequencies of 50/60 Hz. This characteristic is generally complied with, due to the fact that the short-circuit current of a 400 Hz generator is relatively low. In most cases, the generator Isc does not exceed four times the rated current.

Circuit breaker	Curve	Magnetic trip thresholds		Tolerance
		50 Hz	400 Hz	
iDPN, DPN	B	4 In	6 In	± 20 %
	C	8 In	12 In	
	D	12 In	18 In	
iC60	B	4 In	5.6 In	
	C	8 In	11.2 In	
	D	12 In	16.8 In	
C60	B	4 In	5.1 In	
	C	8.5 In	10.9 In	
	D	12 In	15.4 In	
C120 NG125	The NG125 and C120 circuit breakers are not suitable for networks of 400 Hz frequency. Refer to the Compact NSX offer.			

Earth leakage protection devices

The residual current device trip thresholds designed for 50/60 Hz increase with the frequency, but since the human body is less sensitive to the passage of a current at 400 Hz, protection is still ensured for the users.

According to the IEC 60479-2 standard, at 400 Hz the ventricular fibrillation threshold is higher by a ratio of 6 (which means that the physiological effect of a 180 mA current at 400 Hz will be the same as that of a 30 mA current at 50/60 Hz).

Variations in the ventricular fibrillation threshold for shock durations exceeding the period of cardiac cycle (as per IEC 60479-2).

Compatibility of residual current devices at 400 Hz:

Depending on the type and the technology employed, a residual current device designed for a frequency of 50/60 Hz will or will not be capable of ensuring protection for users in accordance with the requirements of the standard.

Type of protection and type of equipment	Use possible on network of 400 Hz frequency	Limit
A type	Not compatible	Trip threshold exceeding the limit given by the curve
AC type	Not recommended	Excessive sensitivity with risk of unwanted tripping (poor guarantee of continuity of service)
<i>Si</i> type		
iID iTG40	YES	
Vigi iC60	Not compatible	Trip threshold exceeding the limit given by the curve
DPN Vigi, Vigi DPN	YES	

Note: The choice of an iID residual current circuit breaker ensures protection for users at 400 Hz while ensuring good continuity of service.

At 400 Hz, the test function of residual current devices designed for 50/60 Hz is not operational due to the increase in the trip threshold.

Auxiliary function

Voltmetric releases

If a circuit breaker needs to be provided with a voltmetric release whose control circuit is powered by the 400 Hz network, it is necessary to use a release auxiliary of appropriate characteristics for 400 Hz networks:

Type	Voltage	Cat. no.
Undervoltage release iMN	115 V AC - 400 Hz	A9A26959

Influence of temperature on the operation

Devices	Characteristics influenced by temperature	Temperature		
		Min.	Max.	
C60H-DC, C60, C120, NG125, C60PV-DC circuit breakers	Tripping on overload	-30°C	+70°C	
DPN circuit breakers	Tripping on overload	-25°C	+70°C	
iK60 circuit breakers	Tripping on overload	-25°C	+60°C	
iC60a/N/H/L circuit breakers	Tripping on overload	-35°C	+70°C	
Circuit breakers	With Vigi (AC)	-5°C	+60°C	
	With Vigi (A, S/I)	-25°C	+60°C	
Reflex iC60	Tripping on overload	-25°C	+60°C	
iC60N/H RCBO, iC60H2 RCBO	Tripping on overload	-15°C	+60°C	
C60NA-DC, SW60PV-DC, C120NA-DC switch-disconnectors	Maximum operating current	-25°C	+70°C	
iID K residual current circuit breakers	Maximum operating current	-5°C	+60°C	
iID residual current circuit breakers	AC	-5°C	+60°C	
	A, S/I	-25°C	+60°C	
Switches	iSW (Acti 9 design)	-25°C	+60°C

RCA, ARA control auxiliaries	None	-25°C	+60°C	
iCT contactors	Installation conditions	-5°C	+60°C	
iTL impulse relays	None	-20°C	+50°C	
Linergy DS	Cat. no. 04040	Maximum operating current	-25°C	+60°C
	Cat. no. 04041			
Linergy FH		Maximum operating current	-25°C	+60°C
iCT, iTL auxiliaries		None	-20°C	+50°C
Linergy DX		Maximum operating current	-25°C	+60°C
Linergy FM	Cat. no. 04000	Maximum operating current	-25°C	+60°C

Note: the temperature considered is the temperature viewed through the device.

Circuit breakers

High temperatures

- A rise in temperature causes lowering of the thermal threshold (tripping on overload).
 - Protection is still ensured: the tripping threshold remains lower than the current acceptable by the cable (I_2)
 - To prevent nuisance tripping, it should be checked that this threshold remains higher than the maximum operating current (I_B) of the circuit, defined by:
 - the rated load currents,
 - the coefficients of expansion and simultaneity of use.
- If the temperature is sufficiently high for the tripping threshold to become lower than the operating current I_B , switchboard ventilation should be provided for.

Low temperatures

- A fall in temperature increases the thermal tripping threshold of the circuit breaker.
- There is no risk of nuisance tripping: the threshold remains higher than the maximum operating current of the circuit (I_B) demanded by the loads.
- It should be checked that the cable remains suitably protected, i.e. that its acceptable current (I_2) is higher than the values shown in the following tables (in amperes).

When the ambient temperature could vary within a broad range, both these aspects must be taken into account:

- the difference between the maximum operating current of the circuit (I_B) and the tripping threshold of the circuit breaker for the minimum ambient temperature,
- the difference between the strength of the cable (I_2) and the maximum tripping threshold of the circuit breaker for the maximum ambient temperature.

Influence of ambient temperature (cont.)

Maximum permissible current

- The maximum current allowed to flow through the device depends on the ambient temperature in which it is placed.
- The ambient temperature is the temperature inside the enclosure or switchboard in which the devices are installed.
- The reference temperature is in a halftone colour for the different devices.

■ When several devices operating simultaneously are mounted side by side in a small enclosure, a temperature rise in the enclosure results in a reduction in the operating current. A reduction coefficient of 0.8 will then have to be assigned to the rating (already derated, if applicable, depending on the ambient temperature).

■ Example:

Depending on the ambient temperature and the method of installation, the table below shows how to determine, for an iC60, the operating currents not to be exceeded for ratings 25 A, 32 A and 40 A (reference temperature 50°C).

Operating current not to be exceeded (A)							
Installation conditions (IEC 60947-2)		iC60 alone			Several iC60 in the same enclosure (calculate with the reduction coefficient indicated below)		
Ambient temperature (°C)		35°C	50°C	65°C	35°C	50°C	65°C
Type	Nominal rating (A)	Actual rating (A)					
iC60	25	26.35	25	23.57	26.35 x 0.8 = 21	25 x 0.8 = 20	23.57 x 0.8 = 19
	32	34	32	29.9	34 x 0.8 = 27	32 x 0.8 = 25.6	29.9 x 0.8 = 24
	40	42.5	40	37.34	42.5 x 0.8 = 34	40 x 0.8 = 32	37.34 x 0.8 = 30

Switches

■ In all cases, the switches are correctly protected against overloads by a circuit breaker with a lower or equal rating, operating at the same ambient temperature.

iCT contactors

In the case of contactor mounting in an enclosure for which the interior temperature is in a range between 50°C and 60°C, it is necessary to use a spacer, cat. no. A9A27062, between each contactor.

Lineryg DS, Lineryg DX, Lineryg FH, Lineryg FM

In all cases, quick distribution blocks (Lineryg DS: cat. no. 04040, 04041), screw distribution blocks, horizontal comb busbars and quick device feeders (Lineryg FM: cat. no. 04000) are correctly protected against overloads by a circuit breaker with a lower or equal rating, operating at the same ambient temperature.

Acti 9 devices have successfully passed the environmental resistance tests specified in the building standards (IEC / EN 60898 and 60947-2 for circuit breakers, IEC / EN 61008 for residual current circuit breakers, etc.). Most of these tests were performed under the control of official bodies in different countries: the devices therefore carry the quality mark issued by each of these bodies.

Schneider Electric has also subjected these devices to additional tests with higher requirements, to give users reliability and sturdiness that are unparalleled on the market.

These tests checked that the constraints described below did not have any significant effect on the main functions of the devices:

- Tripping (for protection devices).
- Isolation and dielectric withstand.
- Degree of protection (IP) of the casing.
- Grip on the mounting bracket (rail).
- Manual opening / closing.

Additional checks were performed for certain tests, mentioned in the tables below.

Constraints Type	Atmospheric				
	Humidity	Salt mist	Corrosive atmospheres		Dust
Standard defining the test protocol	IEC 60068-2-78	IEC 60068.2.52	IEC 60721-3-3		
Constraint level applied	Temperature 40°C, relative humidity 93%.	Severity 2 (maritime environment).	Classification 3C2: urban regions with industrial activities, heavy traffic.	Covered swimming pools atmospheres	Plaster deposits + bumps.
Additional checks after constraint		Conductivity, overheating. No corrosion.			Conductivity and overheating.

Mounting (mm)

The following curves show the total fault current breaking time, depending on its amperage. For example: based on the curve on page 573, an iC60 circuit breaker of curve C, 20 A rating, will interrupt a current of 100 A (5 times the rated current I_n) in:

- 0.45 seconds at least
- 6 seconds at most.

The circuit breakers' tripping curves consist of two parts:

- tripping of overload protection (thermal tripping device): the higher the current, the shorter the tripping time
- tripping of short-circuit protection (magnetic tripping device): if the current exceeds the threshold of this protection device, the breaking time is less than 10 milliseconds. For short-circuit currents exceeding 20 times the rated current, the time-current curves do not give a sufficiently precise representation. The breaking of high short-circuit currents is characterized by the current limiting curves, in peak current and in energy. The total breaking time can be estimated at 5 times the value of the ratio $(I^2t)/(I)^2$.

Verification of the discrimination between two circuit breakers

By superimposing the curve of a circuit breaker on that of the circuit breaker installed upstream, one can check whether this combination will be discriminating in cases of overload (discrimination for all current values, up to the magnetic threshold of the upstream circuit breaker). This verification is useful when one of the two circuit breakers has adjustable thresholds; for fixed-threshold devices, this information is provided directly by the discrimination tables.

To check discrimination on short circuit, the energy characteristics of the two devices must be compared.

Tripping curves

Coordination with loads

The circuit-breaker characteristics chosen depend on the type of load downstream of the installation.

The rating depends on the size of the cables to be protected and the curves depend on the load inrush current.

Product selection according to the load inrush current

When certain "capacitive" loads are switched on, very high inrush currents appear during the first milliseconds of operation. The following graphs show the average non-tripping curves of our products for this time range (50 μ s to 10 ms).

iC60

NG125 / C120

This information allows us to select the most appropriate product, according to the load specifications: curve and rating.

Example

When an iC60 is used with a load with current peaks in the order of 200 I_n during the first 0.1 millisecond, a curve C or D product must be installed.

Prospective current and real limit current.

Definition

The limiting capacity of a circuit breaker is its ability to lessen the effects of a short circuit on an electrical installation by reducing the current amplitude and the dissipated power.

Benefits of limiting

Long installation service life

Thermal effects

Lower temperature rise at the conductor level, hence increased service life for cables and all components that are not self-protected (e.g. switches, contactors, etc.)

Mechanical effects

Lower electrodynamic repulsion forces, hence less risk of deformation or breakage of electrical contacts and busbars.

Electromagnetic effects

Less interference on sensitive equipment located in the vicinity of an electric circuit.

Savings through cascading

Cascading is a technique derived directly from current limiting: downstream of a current-limiting circuit breaker it is possible to use circuit breakers of breaking capacity lower than the prospective short-circuit current (in line with the cascading tables). The breaking capacity is heightened thanks to current limiting by the upstream device. Substantial savings can be achieved in this way on switchgear and enclosures.

Discrimination of protection devices

The circuit breakers' current limiting capacity improves discrimination with the protection devices located upstream: this is because the required energy passing through the upstream protection device is greatly reduced and can be not enough to cause it to trip. Discrimination can thus be natural without having to install a time-delayed protection device upstream.

Acti 9 circuit breaker current limiting

Profiting from Schneider Electric's experience and expertise in the field of short-circuit current breaking, the circuit breakers of the Acti 9 range have a top-level current limiting characteristic for modular devices.

This assures them of optimal protection of the entire power distribution system.

Representation: Current limiting curves

The current limiting capacity of a circuit breaker is reflected by 2 curves which give, as a function of the prospective short-circuit current (current which would flow in the absence of a protection device):

- the real peak current (limited)
- the thermal stress (in A²s), this value, multiplied by the resistance of any element through which the short-circuit current passes, gives the power dissipated by this element.

The straight line "10 ms" representing the energy A²s of a prospective short-circuit current of a half-period (10 ms) indicates the energy that would be dissipated by the short-circuit current in the absence of limiting by the protection device (see example).

Example

What is the energy limited by an iC60N 25 A circuit breaker for a prospective short-circuit current of 10 kA rms. What is the quality of current limiting?

➤ as shown in the graph opposite:

- this short-circuit current (10 kA rms) is likely to dissipate up to 1,000 kA²s
- the iC60N circuit breaker reduces this thermal stress to: 35 kA²s, which is 22 times less.

Example of use: Stresses acceptable by the cables

The following table shows the thermal stresses acceptable by the cables depending on their insulation, their composition (Cu or Al) and their cross section. Cross-section values are expressed in mm² and stresses in A²s.

S (mm ²)		1.5	2.5	4	6	10
PVC	Cu	2.97 x 10 ⁴	8.26 x 10 ⁴	2.12 x 10 ⁵	4.76 x 10 ⁵	1.32 x 10 ⁶
	Al					5.41 x 10 ⁵
PRC	Cu	4.10 x 10 ⁴	1.39 x 10 ⁵	2.92 x 10 ⁵	6.56 x 10 ⁵	1.82 x 10 ⁶
	Al					7.52 x 10 ⁵
S (mm ²)		16	25	35	50	
PVC	Cu	3.4 x 10 ⁶	8.26 x 10 ⁶	1.62 x 10 ⁷	3.21 x 10 ⁷	
	Al	1.39 x 10 ⁶	3.38 x 10 ⁶	6.64 x 10 ⁶	1.35 x 10 ⁷	
PRC	Cu	4.69 x 10 ⁶	1.39 x 10 ⁷	2.23 x 10 ⁷	4.56 x 10 ⁷	
	Al	1.93 x 10 ⁶	4.70 x 10 ⁶	9.23 x 10 ⁶	1.88 x 10 ⁷	

Example

Is a Cu/PVC cable of cross section 10 mm² protected by a NG125L device?

The above table shows that the acceptable stress is 1.32 x 10⁶ A²s. Any short-circuit current at the point where a NG125L device (I_{cu} = 25 kA) is installed will be limited, with a thermal stress of less than 2.2 x 10⁵ A²s. (Curve on page 589).

The cable is therefore always protected up to the breaking capacity of the circuit breaker.

IEC 60947-2, Annex A IEC 60364-4-43 § 434.5.1

What is cascading?

Cascading is the use of the current limiting capacity of circuit breakers at a given point to permit installation of lower-rated and therefore lower-cost circuit breakers downstream.

The upstream Compact circuit breakers acts as a barrier against short-circuit currents. In this way, downstream circuit breakers with lower breaking capacities than the prospective short-circuit (at their point of installation) operate under their normal breaking conditions.

Since the current is limited throughout the circuit controlled by the limiting circuit breaker, cascading applies to all switchgear downstream. It is not restricted to two consecutive devices.

General use of cascading

With cascading, the devices can be installed in different switchboards. Thus, in general, cascading refers to any combination of circuit breakers where a circuit breaker with a breaking capacity less than the prospective I_{sc} at its point of installation can be used. Of course, the breaking capacity of the upstream circuit breaker must be greater than or equal to the prospective short-circuit current at its point of installation.

The combination of two circuit breakers in cascading configuration is covered by the following standards of:

- design and manufacture of circuit breakers (IEC 60947-2, Annex A),
- electrical distribution networks (IEC 60364-4-43 § 434.5.1).

Coordination between circuit breakers

The use of a protective device possessing a breaking capacity less than the prospective short-circuit current at its installation point is permitted as long as another device is installed upstream with at least the necessary breaking capacity. In this case, the characteristics of the two devices must be coordinated in such a way that the energy let through by the upstream device is not more than that which can be withstood by the downstream device and the cables protected by these devices without damage.

Cascading can only be checked by laboratory tests and the possible combinations can be specified only by the circuit breaker manufacturer.

Cascading and protection discrimination

In cascading configurations, due to the Roto-active breaking technique, discrimination is maintained and, in some cases, even enhanced. Consult the enhanced discrimination tables on page 622 for data on discrimination limits.

Cascading tables

Schneider Electric cascading tables are:

- drawn up on the basis of calculations (comparison between the energy limited by the upstream device and the maximum permissible thermal stress for the downstream device)
 - verified experimentally in accordance with IEC standard 60947-2.
- For 50/60 Hz distribution systems with 220-240 V, 380-415 V and 440 V between phases, the tables of the following pages indicate cascading possibilities between upstream Compact and downstream Acti 9 and Compact circuit breakers as well as between upstream Masterpact and downstream Compact circuit breakers. Circuit breaker with Vigi module (Add-On Residual Current Device - RCD): When circuit breakers are equipped with Vigi module, the following cascading tables are still applicable.

Using the cascading tables

This table takes into account all types of faults: between phases, phase and neutral, phase and earth in all earthing systems.

In IT the following cascading tables can not be used to improve performances in case of "double fault" between two different phases and earth in two different locations of the installation. Each breaker shall comply to IEC60947-2 Annex H to be used in such a system.

Depending on the network and the type of downstream circuit breaker, the selection table below indicates which table should be consulted to find out the cascading value.

Selection table

(1) For fault phase-neutral with upstream protection of neutral, please consult the table Ue: 220-240 V.

(2) For iC60 1P+N circuit breaker connected between phase and neutral under 220-240 V, consult the table Ue: 220-240 V (only for faults between phase and neutral).

Example of three level cascading

Consider three circuit breakers A, B and C connected in series. The criteria for cascading are fulfilled in the following two cases:

- the upstream device A is coordinated for cascading with both devices B and C (even if the cascading criteria are not fulfilled between B and C). It is simply necessary to check that the combinations A + B and A + C have the required breaking capacity

- each pair of successive devices is coordinated, i.e. A with B and B with C (even if the cascading criteria are not fulfilled between A and C). It is simply necessary to check that the combinations A + B and B + C have the required breaking capacity. The upstream breaker A is a NSX250L (breaking capacity 150 kA) for a prospective I_{sc} of 80 kA across its output terminals.

A NSX100B (breaking capacity 25 kA) can be used for circuit breaker B for a prospective I_{sc} of 40 kA across its output terminals, since the "reinforced" breaking capacity provided by cascading with the upstream NSX250L is 50 kA.

A C60H (breaking capacity 15 kA) can be used for circuit breaker C for a prospective I_{sc} of 24 kA across its output terminals since the "reinforced" breaking capacity provided by cascading with the upstream NSX250L is 25 kA.

Note that the "reinforced" breaking capacity of the C60H with the NSX100B upstream is only 20 kA, but:

- A + B = 50 kA
- A + C = 25 kA.

Discrimination enhanced by cascading

With traditional circuit breakers, cascading between two devices generally results in the look of discrimination.

With Compact circuit breakers, the discrimination characteristics in the tables remain applicable and are in some cases even enhanced. Protection discrimination is ensured for short-circuit currents greater than the rated breaking capacity of the circuit breaker and even, in some cases, for its enhanced breaking capacity. In the later case, **protection discrimination is total**, i.e. only the downstream device trips for any and all possible faults at its point in the installation.

Example

Consider a combination between:

- a Compact NSX250H with trip unit TM250D
- a Compact NSX100F with trip unit TM25D.

The discrimination tables indicate total discrimination. Protection discrimination is therefore ensured up to the breaking capacity of the NSX100F, i.e. **36 kA**.

The cascading tables indicate an enhanced breaking capacity of **70 kA**.

The enhanced discrimination tables indicate that in a cascading configuration, discrimination is ensured up to **70 kA**, i.e. for any and all possible faults at that point in the installation.

Enhanced discrimination tables - 380-415 V

For each combination of two circuit breakers, the tables indicate the:

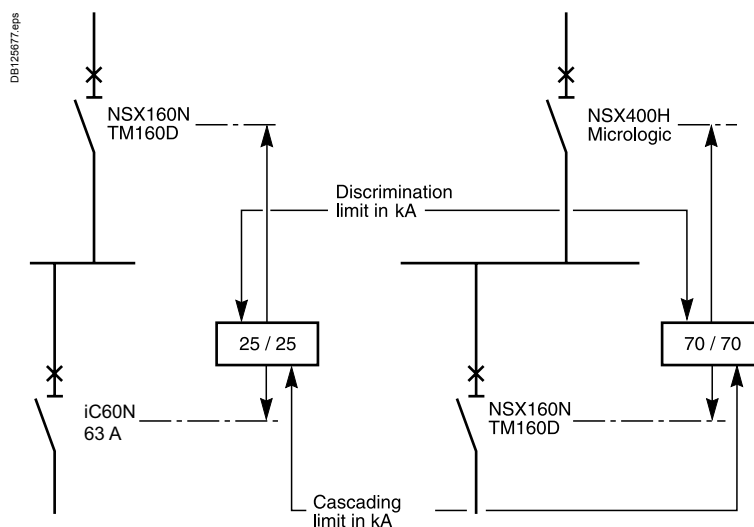

In a table, a box containing two equal values indicates that discrimination is provided up to the reinforced breaking capacity of the downstream device.

These tables apply only to cases with combined discrimination and cascading between two devices. For all other cases, refer to the normal cascading and discrimination tables.

Technical principle

Enhanced discrimination is the result of the exclusive Compact NSX Roto-active breaking technique which operates as follows:

- due to the short-circuit current (electrodynamic forces), the contacts in both devices simultaneously separate. The result is major limitation of the short-circuit current
- the dissipated energy provokes the reflex tripping of the downstream device, but is insufficient to trip the upstream device.

Note: respect the basic rules of discrimination, in terms of overload, short-circuit, see 557E4300.indd/638 and 557E4305.indd/644.

Coordination between circuit breakers

Discrimination (Selectivity)

E002487-37.eps

IEC/EN 60947-2

What is discrimination?

It is the coordination of automatic cut-off devices for a fault that occurs at any point in the network to be eliminated by the upstream circuit breaker, the circuit breaker that is immediately upstream of the fault and by that circuit breaker alone!

D0621201.eps

Continuity of service

Discrimination is an essential element that must be taken into account as early as in the design of a low voltage installation to enable continuity of the electricity service.

Production and safety

Discrimination provides much convenience for all users, but it is an essential requirement when continuity of service is of utmost importance.

Discrimination means that only the part with the fault is disconnected. It enables:

- continuity of supply for adjacent circuits,
- localization of the faulty circuit.

For some installations or installation parts:

- operating theatre in clinics and hospitals,
- marine,
- safety equipment,
- production site.

The requirements for continuous electricity often make it necessary to verify the discrimination between upstream and downstream protection devices.

If there is a total lack of discrimination, it will be necessary to try to achieve partial discrimination. Likewise, if there is a limit to the level of discrimination and this proves satisfactory in the majority of cases, it can still be attempted to make it total. Of course, any modification must be made while observing the following main parameters:

- protection of personnel,
- are the thermal stresses I^2t of the cables always taken into account?
- are the breaking capacities of the devices higher than the prospective I_{sc} ?

Finally, when it is not possible to achieve discrimination and it is essential for the correct operation of the installation, the installation of uninterruptible power supplies (UPS) must be considered. Generator units, inverters, etc. are then used.

There are several types of discrimination that can be used separately or together. For protection against overcurrent, this generally concerns current discrimination and time discrimination.

The principle is as follows.

Coordination between circuit breakers

Discrimination (Selectivity)

DB421202.eps

Current and energy discrimination

Discrimination involves ensuring coordination between two circuit breakers in series, so that, in the event of a fault, only one circuit breaker, located immediately upstream of the fault, trips. A discrimination current I_s is defined so that:

- If $I_{\text{fault}} < I_s$: only D2 eliminates the fault, discrimination is ensured,
- If $I_{\text{fault}} > I_s$: both circuit breakers may trip, discrimination is not ensured.

Slight overcurrent or overload

Under the effect of an abnormal inrush current, for example an increase in the resistive torque of a motor, the current going through the circuit is higher than the rated current. These currents may damage the installation (risk of an electrical fire). Devices to protect against overcurrent can be characterized by their operating curves as a function of prospective current I_p :

- the operating curve is time-based when the breaking time is greater than 50 ms (curve $t = f(I_p)$). Discrimination is achieved if the I_n upstream / I_n downstream operation threshold ratio is > 1.3 and if the current offset of the magnetic curves is observed.

This is current discrimination

The greater the difference between the ratings of the upstream and downstream circuit breakers, the more "extensive" the discrimination.

Short circuit

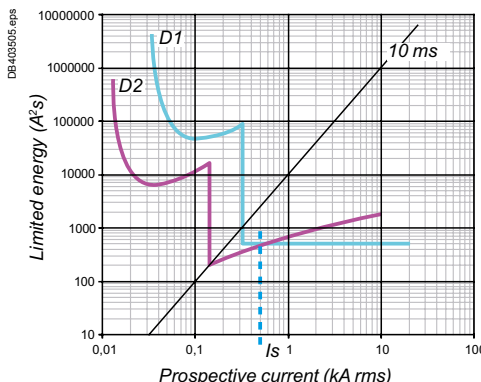

For example when there is contact between two phases we are faced with a full insulation fault which risks damaging the installation.

The function that makes it possible to protect against this type of fault is magnetic protection.

To ensure discrimination, we must maintain a ratio between the upstream and downstream protection devices. This is energy discrimination.

- Energy: when the intervention time is less than 50 ms and more particularly less than the time of one half wave (10 ms) of current with limiting circuit breakers.

This is energy discrimination

Coordination between circuit breakers

Discrimination (Selectivity)

Time discrimination

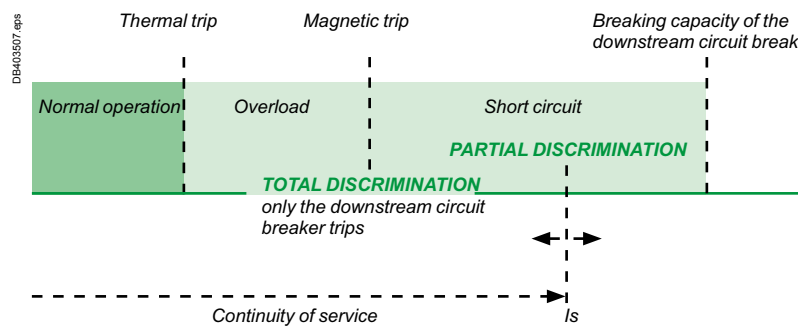

The principle is based on the time difference (Δt) of the upstream magnetic curve.

To achieve this, it is necessary to have an upstream circuit breaker with time-delay bands.

The delay introduced must make it possible to improve discrimination without endangering the cable or busbars which would then have to withstand the overcurrent for longer (greater thermal effects I^2t and electrodynamic stresses).

Total or partial discrimination

Discrimination may be partial or total, up to the breaking capacity of the downstream circuit breaker. For total discrimination, the characteristics of the upstream device must be higher than those of the downstream device (higher than the breaking capacity of the downstream circuit breaker MCCB).

Standard IEC 60947-2 on industrial circuit breakers, and in particular Appendix A, deals with coordination between a circuit-breaker and another device to protect against short circuits combined in the same circuit. This protection device may be a fuse or another circuit breaker.

Coordination between circuit breakers

Discrimination (Selectivity)

Discrimination between modular circuit breakers

We use two types of discrimination when these circuit breakers are combined:

- current discrimination,
- energy discrimination.

For discrimination to be ensured whatever the prospective fault current, 3 conditions have to be fulfilled:

- the upstream and downstream circuit breakers must have different ratings (ratio > 1.3),
- the envelope of their magnetic curves must be different,
- the energy allowed to pass through the downstream circuit breaker when it cuts off must still be less than the operating energy of the upstream trip.

Example

■ Let us take the example of a single phase network where we have a 32 A curve D circuit breaker in series with a 10 A curve D circuit breaker:

- the 32 A circuit breaker protects the 6² cables and the 10 A circuit breaker protects the 1.5² cables. This combination allows discrimination, but up to what threshold?
- if current discrimination is considered ($t = f(I_p)$) it can be seen that the tripping curve of the downstream circuit breaker is well below the non-tripping curve of the upstream circuit breaker,
- furthermore, each circuit breaker is well below the maximum stress permitted by the cables.

When considering energy discrimination, it is necessary to compare the maximum stresses characterized by the integrals $\int I^2 dt$ relative to the development of the arc in the downstream device and by the sensitivity of the trip unit, still in $\int I^2 dt$, of the upstream device (curves $I^2 t = f(I_p)$).

Coordination between circuit breakers

Discrimination (Selectivity)

Discrimination between Compact NSX upstream and modular circuit breakers downstream

Compact NSX circuit breakers have been designed to ensure total discrimination with Acti9 range.

- Total discrimination between Compact NSX 100 A with electronic trip unit and Acti9 circuit breaker up to 40 A.
- Total discrimination between Compact NSX ≥ 160 A with TMD trip unit ≥ 125 A or electronic trip unit and Acti9 up to 63 A.

Discrimination between Compact NSX circuit breakers

Thanks to the Roto-Active breaking principle in the Compact NSX, a combination of Schneider Electric circuit breakers provides an exceptional level of discrimination between protection devices.

This performance is due to the combination and optimization of 3 principles:

- current discrimination,
- energy discrimination,
- time discrimination.

Protection against overloads: current discrimination

The protection is selective if the ratio between the setting thresholds is higher than 1.6 (in the case of two distribution circuit breakers).

Protection against weak short circuits: time discrimination

Tripping of the upstream device has a slight time delay; tripping of the downstream device is faster.

The protection is selective if the ratio between the short-circuit protection thresholds is no less than 1.5.

Protection against high short circuits: energy discrimination

This principle combines the exceptional limiting power of the Compact NSX devices and reflex release, sensitive to the energy dissipated by the short circuit in the device.

When a short circuit is high, if it is seen by two devices, the downstream device limits it greatly. The energy dissipated in the upstream device is insufficient to cause it to trip: there is discrimination whatever the value of the short circuit.

The range has been designed to ensure energy discrimination between NSX630/NSX250/NSX100 or NSX400/NSX160.

Discrimination between Masterpact or Compact NS ≥ 630 A upstream and Compact NSX downstream

Thanks to their high-performance control units and a very innovative design, Masterpact and Compact NS ≥ 630 A devices offer, as standard, a very high level of discrimination with downstream Compact NSX up to 630 A

Respect the basic rules of discrimination for overload and short-circuit, or check that curves do not overlap with Ecodial software.

Check the discrimination limit in tables for high short-circuit current or when using limiter circuit breakers (Masterpact NT L1 or Compact NS L or LB) upstream.

Discrimination between Masterpact or Compact NS ≥ 630 A upstream and downstream

The utilization category of these devices (excepted limiters ones) is B according to IEC 60947 standard. Discrimination is ensured by a combination of current discrimination and time discrimination.

Respect the basic rules of discrimination for overload and short-circuit, or check that curves do not overlap with Ecodial software.

Check the discrimination limit in tables for high short-circuit current or when using limiter circuit breakers (Masterpact NT L1 or Compact NS L or LB).

Basic rules of discrimination for overload and short-circuit

Upstream	Downstream	Thermal protection	Magnetic protection
		I_r upstream / I_r downstream	I_m upstream / I_m downstream
TM	TM or MCB	≥ 1.6	≥ 2
	Micrologic	≥ 1.6	≥ 1.5
Micrologic	TM or MCB	≥ 1.6	≥ 1.5
	Micrologic	≥ 1.3	$\geq 1.5^{(1)}$

(1) See "Additional conditions according to the trip units".

Coordination between circuit breakers

Discrimination (Selectivity)

Additional conditions according to the trip units

Short time trip pickup current (I_{sd})

The tables show the limit of discrimination assuming the short time trip pickup current $I_{sd} = 10 \times I_r$.

In many cases, when discrimination is total, a different adjustment may be used provided that the ratio between the magnetic thresholds indicated above is observed.

When downstream breaker is a Compact NSX:

■ upstream circuit breaker magnetic setting shall be higher than downstream instantaneous protection:

NSX 2.2 ou 2.3	Mic 2.2 40	Mic 2.2 100	Mic 2.2 160	Mic 2.2 250	Mic 2.3 400	Mic 2.3 630
Inst.	600 A	1500 A	2400 A	3000 A	4800 A	6900 A

■ or upstream circuit breaker shall be equipped with micrologic type 5 with $t_{sd} \geq 0.1$. When downstream circuit breaker is a Masterpact with micrologic 2, upstream circuit breaker shall be equipped with micrologic type 5 and $t_{sd} \geq 0,1$ and Ii Off. When the limit of discrimination indicated in the table is $10 \times I_r$, the limit of discrimination is in fact the upstream magnetic threshold I_{sd} .

Instantaneous trip pickup current (I_i)

The tables show the limit of discrimination assuming the instantaneous trip pickup current set to its maximum value and when it is inhibited (category B circuit breaker only).

■ When the limit of discrimination indicated in the table is $15 \times I_n$ of the upstream device, the limit of discrimination is in fact the instantaneous trip pickup current of the upstream device.

■ When the upstream device is a type B circuit breaker and the downstream device is type A, the instantaneous trip pickup current of the upstream device may be set to below $15 \times I_n$ as long as it remains higher than the reflex release threshold of the downstream device.

Short time tripping delay (T_{sd})

When the upstream and downstream circuit breakers are fitted with a Micrologic 5.x, 6.x, 7.x: trip unit, the minimum non-tripping time of the upstream device must be greater than the maximum tripping time of the downstream device.

T_{sd} D1 > T_{sd} D2 (One band)

I²t Off / On

The tables show the limit of discrimination assuming function I²t OFF. If this is not the case, the user must verify that the curves do not overlap.

Ground Fault Protection (GFP) (I_g, T_g)

When the upstream and downstream circuit breakers are fitted with a Micrologic 6.x trip unit, the user must verify current and time discrimination:

current discrimination

The setting of the tripping threshold of the upstream GFP is greater than that of the downstream GFP. Because of the tolerances on the settings, a difference of 30 % between the upstream threshold and the downstream threshold is sufficient.

time discrimination

The intentional time-delay setting for the upstream GFP is higher than the opening time of the downstream protection device. Furthermore, it is essential that the intentional time-delay applied to the upstream protection device observes the maximum insulation fault elimination time defined by NEC § 230.95 (i.e. 1 s for 3000 A).

I_g D1 ≥ 1.3 I_g D2 T_g D1 > T_g D2 (One band)

Circuit breaker with vigi module (Add-On Residual Current Device - RCD):

When circuit breakers are equipped with vigi module, discrimination tables are valid for short-circuit. To ensure discrimination in case of earth fault, upstream and downstream vigi modules shall satisfy the following conditions:

■ the sensitivity of the upstream residual current device must be at least equal to three times the sensitivity of the downstream residual current device ($I_{\Delta n} D1 \geq 3 \times I_{\Delta n} D2$),

■ the upstream residual current device must be:

- of the selective (S) type (or setting) if the downstream residual current device is an instantaneous type,
- of the delayed (R) type (or setting) if the downstream residual current device is a selective type.

The minimum non-tripping time of the upstream device will therefore be greater than the maximum tripping time of the downstream device for all current values ($\Delta t (D1) > \Delta t (D2)$).

Coordination between circuit breakers

Discrimination of modular circuit breakers

Using the discrimination tables

Depending on the network and the type of downstream circuit breaker, the selection table below indicates which table should be consulted to find out the discrimination value.

The discrimination values are given in colour-coded tables.

■ For 220-240 V/380-415 V 50/60 Hz systems:

□ in the case of a 2P downstream circuit breaker in a single-phase network (220-240 V), refer to the light green tables,

□ in the case of 1P, 1P+N, 3P, 3P+N, 4P and 2P circuit breakers in a two-phase network (380-415 V), refer to the dark green tables.

Selection table

	 DB123995 eps	□	□	□

Note: this selection table shows you the colour.

By taking your downstream protection device, the type of upstream network and its voltage you can refer to the corresponding discrimination table.

Coordination between circuit breakers

Discrimination of modular circuit breakers

Example: solution diagram

Upstream we have a NG125N 80 A 2P curve D and downstream an iC60N 32 A 2P curve C. The network is 230 V between phase and neutral. By referring to the light green table on the discrimination page for NG125N curve D with iC60 downstream, we find 2200 A.

If the downstream product is replaced by an iDPN 1P+N curve C, you will use the dark green table for NG125N curve D and iDPN1P+N downstream. The discrimination level is 2400 A for a 16 A.

Specifications

We want to achieve continuity of service in the event of a fault downstream of the NG125N 80 A. This circuit has an I_{sc} of 2.2 kA under a voltage of 230 V. By referring to the table for 230 V, 1P+N network, we find that for an upstream NG125N curve D with a rating of 80 A, we can have total discrimination up to 16 A if we use an iC60N 1P+N and up to 32 A with an iC60N 2P.

Discrimination between circuit breakers

In the following tables we show the level of discrimination between two LV circuits that are protected by circuit breakers.

This discrimination will be either:

- total: represented by a T (up to the breaking capacity of the downstream device),
- partial: discrimination limit current (Is) indicated. Below this value discrimination is ensured, above this value the upstream device is also involved in breaking,
- zero: no discrimination ensured.

Discrimination table

Note: the discrimination limits given in the table must be compared to the phase/neutral fault current (I_{k1}).
If the max. phase/earth fault current (I_f) is high, the discrimination of this fault current should also be verified by referring to the limits given in the dark green part of the table.

$U_e \leq 440 \text{ V AC}$

Discrimination between circuit breakers

In the following tables we show the level of discrimination between two LV circuits that are protected by circuit breakers up to 440 V, 50/60 Hz systems.

This discrimination will be either:

- total: represented by a T (up to the breaking capacity of the downstream device),
- partial: discrimination limit current (Is) indicated. Below this value discrimination is ensured, above this value the upstream device is also involved in breaking,
- zero: no discrimination ensured.

(1) With I_r upstream > 1,3 I_r downstream.

- T Total discrimination, up to the breaking capacity of the downstream circuit breaker.
- 4 Discrimination limit = 4 kA.
- No discrimination.

Discrimination table

Upstream: type gG BS88 and NH fuse

Downstream: iC60 circuit breaker

Selectivity

Selectivity between MCB iC60 and fuse gG in upstream according to the IEC 60947-2 annexe A.

The table below shows the limits of selectivity for a short-circuit current in kA with a fuse in upstream and a MCB iC60 in downstream.

Upstream		Fuse gG BS88 and NH

19 Please respect the breaking capacity of the circuit breaker (iC60N: 10 kA, iC60H: 15 kA)

1.9 Discrimination limit (kA) = 1.9 kA.

T Total discrimination.

No discrimination.

Example:

Combination of a fuse gG 63 A in upstream with a MCB iC60 of 25 A B curve in downstream, selectivity up to a short circuit current of 2.1 kA.

Cascading

The table below shows the enhanced breaking capacity thanks to cascading of the iC60 MCB and the maximum rating of the upstream fuse.

Upstream	In (A)	Fuse gG BS88 and NH		
		16-100	125	160
Downstream device				
iC60N	10 kA	50 kA	35 kA	-
iC60H	15 kA			
iC60L	25-20-15 kA			

The enhanced breaking capacity is indicated in kA according to IEC 60947-2 annex A.

Discrimination table

Upstream: type gG Diazed D02 fuse
Downstream: iC60 circuit breaker

Selectivity

Selectivity between MCB iC60 and fuse gG in upstream according to the IEC 60947-2 annexe A.

The table below shows the limits of selectivity for a short-circuit current in kA with a fuse in upstream and a MCB iC60 in downstream.

Upstream	In (A)	Type gG Diazed D02 fuse						
		20	25	32	35	40	50	63

Downstream Rating (A)

Discrimination limit (kA)

iC60 Curve B	Rating (A)	Discrimination limit (kA)

Circuit breakers for direct current applications (cont.)

24 V - 48 V direct current applications

Typical applications

Direct current has been used for a long time, and in many fields. It offers major advantages, in particular immunity to electrical interference. Moreover, direct-current installations are now simpler, because they benefit from the development of power supplies with electronic converters and batteries.

- Communication or measurement network:
 - 48 V DC switched telephone network,
 - 4-20 mA current loop.
- Electrical supply for industrial PLCs:
 - PLCs and peripheral devices (24 or 48 V DC).
- Auxiliary uninterruptible direct current power supply:
 - relays or electronic protection units for MV cubicles,
 - switchgear opening / closing trip units,
 - LV control and monitoring relays,
 - indicator lights,
 - circuit-breaker or on/off switch motor drives,
 - power contactor coils,
 - control/monitoring and supervision devices with communication that can be powered via a separate uninterruptible power supply.
- 24 to 48 V DC wind application:
 - isolated homes,
 - cottages, bungalows, mountain refuges,
 - pumps, street lighting,
 - measuring instruments, data acquisition,
 - telecommunication relays,
 - industrial applications.

Types of direct current networks

According to the types of DC networks illustrated below, we can identify the risks to the installation and define the best means of protection.

Earthed		Isolated from earth	
I: Earthed (or grounded) polarity (in this case negative)		II: Earthed mid-point	III: Isolated polarities
1 pole (1P isolation)	2 poles (2P isolation)	2 poles	2 poles
			
	2 poles (1P isolation 1P+N)		
			
Worst-case faults			
Fault A and fault B (if only one polarity is protected)		Fault B	Double fault A and D or C and E

For further information on the types of networks and the faults that characterise them, refer to the direct current circuit breaker (LV) selection guide, 220E2100.indd.

For all these configurations, we propose a single protection solution that depends only on the requirement for the nominal current I_n and the short-circuit current I_{sc} at the installation point concerned.

The second important point in our solution is the fact that the protection is implemented by non-polarised circuit breakers that can operate efficiently, whatever the direction of the direct current.

Circuit breakers for direct current applications (cont.)

24 V - 48 V direct current applications

24 - 48 V direct current protection solution

The performance levels shown in the tables below correspond to the most critical faults according to the network configuration.

- Breaking on one pole.
- Fault between polarity and earth (Fault A).

Standard solution depending on the network and the requirements of the installation (I_n / I_{sc})

In addition to the parameters shown on the following pages, the tables below illustrate our range of circuit breakers according to the nominal current of the load and short-circuit current at the point of installation.

- Circuit breaker rating.
- Breaking capacity of the circuit breaker.

1 pole isolation solution (1P)

Circuit breakers for direct current applications (cont.)

2 pôles isolation solution (2P)

(*) 3P NG125N connected in a two-pole configuration to reach 125 A (1P / 2P NG125 has a maximum rating of 80 A).

1 pole isolation solution (1P+N)

Specific use of the iDPN range in a network with one polarity earthed and both poles isolated: compact solution (1P+N in 18 mm).

(*) iC60a breaking capacity I_{cu} = 10 kA.

Constraints related to "direct current" applications

In direct current, inductors and capacitors do not disturb the operation of the installation in steady state. Capacitors are charged and inductors no longer oppose changes in the current.

However, they create transient phenomena when the circuit opens or closes, during which time the current varies. Actual loads have both characteristics and generate oscillatory phenomena.

Type of load

Inductive load

An inductive load will tend to lengthen the current interrupt or establishment time, because the inductance L then opposes the change in the current ($L di/dt$). The transient phenomenon will mainly be characterised by a time constant imposed by the load and whose value corresponds approximately to the interrupt or closing time that the switchgear has to withstand. In addition, during the interrupt time, the switchgear must be able to withstand the additional energy stored in the inductor in steady state.

An inductive load therefore requires particular attention with respect to its time constant.

A low value (typically < 5 ms) facilitates interruption.

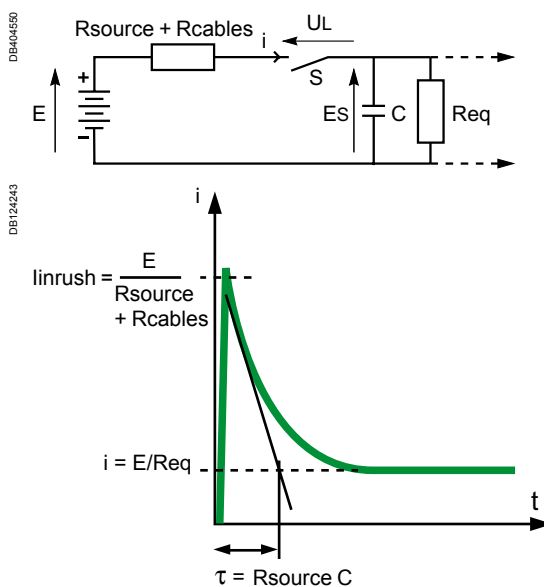

Inductive load

Capacitive load

During a closing operation, a capacitive load will cause an inrush current due to the load on the capacitor, virtually under short-circuit condition at the beginning of the phenomenon.

On opening, it will tend to discharge. The time constant is generally very low (< 1 ms) and its effect is secondary with respect to the inrush current. A capacitive load will require particular attention to the inrush or discharge current surges.

Capacitive load

Circuit breakers for direct current applications (cont.)

24 V - 48 V direct current applications

Time constant L/R

When a short-circuit occurs across the terminals of a direct current circuit, the current increases from the operating current ($< I_n$) to the short-circuit current I_{sc} during a time depending on the resistance R and the inductance L of the short-circuited loop.

The equation that governs the current in this loop is: $U = Ri + Ldi/dt$.

A short-circuit current is established (neglecting I_n with respect to I_{sc}) by the equation:

$$i = I_{sc} (1 - \exp(-t/\tau)),$$

where $\tau = L/R$ is the time constant used to establish the short-circuit.

In practice, after a time $t = 3\tau$ the short-circuit is considered to be established, because the value of $\exp(-3) = 0.05$ is negligible compared to 1.

The lower the corresponding time constant (e.g. battery circuit), the faster a short-circuit is established.

L/R	Description	DC applications
2 ms	Very fast short-circuit	<ul style="list-style-type: none"> ■ Photovoltaic applications
5 ms	Fast short-circuit established	<ul style="list-style-type: none"> ■ Resistive or slightly inductive circuits: <ul style="list-style-type: none"> <input type="checkbox"/> indicator light <input type="checkbox"/> trip units (MN, MX) <input type="checkbox"/> motor armatures <input type="checkbox"/> battery charger/uninterruptible power supply (UPS) ■ Capacitive circuits: electronic controller
15 ms	Standardised value used in standard IEC 60947-2	<ul style="list-style-type: none"> ■ Inductive circuits: <ul style="list-style-type: none"> <input type="checkbox"/> electromagnetic coil <input type="checkbox"/> contactor coil <input type="checkbox"/> motor inductor
30 ms	Slower short-circuit established	<ul style="list-style-type: none"> ■ Highly inductive circuits: <ul style="list-style-type: none"> <input type="checkbox"/> electromagnetic coil <input type="checkbox"/> contactor coil <input type="checkbox"/> motor inductor

In general, the system time constant is calculated under worst case conditions, across the terminals of the generator.

Circuit breakers for direct current applications (cont.)

24 V - 48 V direct current applications

Tripping curves

We can choose our solution according to the inrush currents generated by our loads, in the same way as for alternating current. In direct current, the same thermal tripping curves are obtained as in alternating current. The only difference is that the magnetic thresholds are offset by a coefficient $\sqrt{2}$ compared to the curves obtained in alternating current.

Characteristics of the various curves and their applications:

Curves	Magnetic thresholds		DC applications
	AC	DC	
Z	2.4 to 3.6 In	3.4 to 5 In	<ul style="list-style-type: none"> Resistive loads Loads with electronic circuits
B	3.2 to 4.8 In	4.5 to 6.8 In	<ul style="list-style-type: none"> Motor inductor: starting current 2 to 4 In Battery charger/Uninterruptible power supply (UPS)
C	6.4 to 9.6 In	9.05 to 13.6 In	<ul style="list-style-type: none"> Electronic controller
D and K	9.6 to 14.4 In	13.6 to 20.4 In	<ul style="list-style-type: none"> Electromagnetic coil: inrush overvoltage 10 to 20 Un LV relay Trip units (MN, MX) Indicator light PLCs (industrial programmable logic controllers)

The figures opposite are iC60 tripping curves showing DC magnetic thresholds and normative limits

Example

Protection of the 4 mm² cable supplying a load at In = 30 A with a 32 A rating and a tripping curve that allows the starting current for this load to be absorbed.

Curves B, C, D, ratings 6 A to 63 A

Curves Z, K, ratings 6 A to 63 A

Curve C, rating 32 A (AC magnetic thresholds in dotted lines)

Circuit breakers for direct current applications (cont.)

24 V - 48 V direct current applications

Continuity of service of the solutions

Discrimination of the direct current protection devices

Discrimination is a key element that must be taken into account right from the design stage of a low-voltage installation to allow continuity of service of the electrical power.

Discrimination involves coordination between two circuit breakers connected in series, so that in the event of a fault, only the circuit breaker positioned immediately upstream of the fault trips. A discrimination current I_s is defined as:

- $I_{\text{fault}} < I_s$: only D2 removes the fault, discrimination ensured,
- $I_{\text{fault}} > I_s$: both circuit breakers may trip, discrimination not ensured.

Discrimination may be partial or total, up to the breaking capacity of the downstream circuit breaker. To ensure total discrimination, the characteristics of the upstream device must be higher than those of the downstream one.

The same principles apply to designing both direct current and alternating current installations. Only the limit currents change when direct current is used.

Once again, we find the same concepts of discrimination:

- **total**: up to the breaking capacity of the downstream device. Our tests have been performed at up to 25 kA or 50 kA depending on the breaking capacity of the devices in question.
- **partial**: indication of the discrimination limit current I_s . Discrimination is ensured below this value; above this value, the upstream device participates in the breaking process,
- **none**: no discrimination ensured, the upstream and downstream circuit breakers will trip.

For further information about the discrimination concept for protection devices in general, refer to technical supplement 557E4300, "Discrimination of modular circuit breakers".

Total discrimination solutions

In the following tables, we offer you solutions that favour continuity of service (total discrimination between circuit breakers), for different short-circuit currents.

Total discrimination: 10 kA

		Upstream Curve C Time constant (L/R) = 15 ms

Circuit breakers for direct current applications (cont.)

24 V - 48 V direct current applications

Coordination with loads

As seen above, the circuit-breaker characteristics chosen depend on the type of load downstream of the installation.

The rating depends on the size of the cables to be protected and the curves depend on the load inrush current.

Product selection according to the load inrush current

When certain "capacitive" loads are switched on, very high inrush currents appear during the first milliseconds of operation. The following graphs show the average DC non-tripping curves of our products for this time range (50 μ s to 10 ms).

iC60

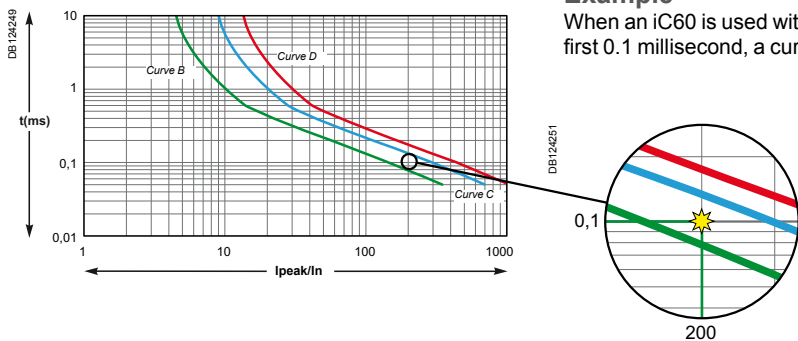

NG125 / C120

This information allows us to select the most appropriate product, according to the load specifications: curve and rating.

Example

When an iC60 is used with a load with current peaks in the order of 200 I_n during the first 0.1 millisecond, a curve C or D product must be installed.

Circuit breakers for direct current applications (cont.)

24 V - 48 V direct current applications

Standards: IEC 60479-2, NF C 15100, IEC 60755.

Personal protection

Personal protection (earth-leakage protection) is not mandatory for this voltage range (24-48 V DC).

In fact, according to the standards currently in force, the minimum ventricular fibrillation current **If** for human beings is in the order of 25 mA for alternating current (50 Hz), whereas for direct current, it is more than 50 mA.

The table below shows the data according to the standards and conditions:

Environment		Voltage specifications	
		AC	DC
Dry environment	$U_f = Z \times I_f$	50 V	100 V
Wet environment	$U_f = Z \times I_f$	25 V	50 V

With **Z** corresponding to the impedance of the human body in the different types of environment, **If** being the current passing through the body and **Uf** the minimum contact voltage required to reach the danger current.

Under normal operating conditions, this voltage range (< 50 V) is therefore not dangerous to human beings.

Circuit breakers for direct current applications (cont.)

24 V - 48 V direct current applications

Examples of applications

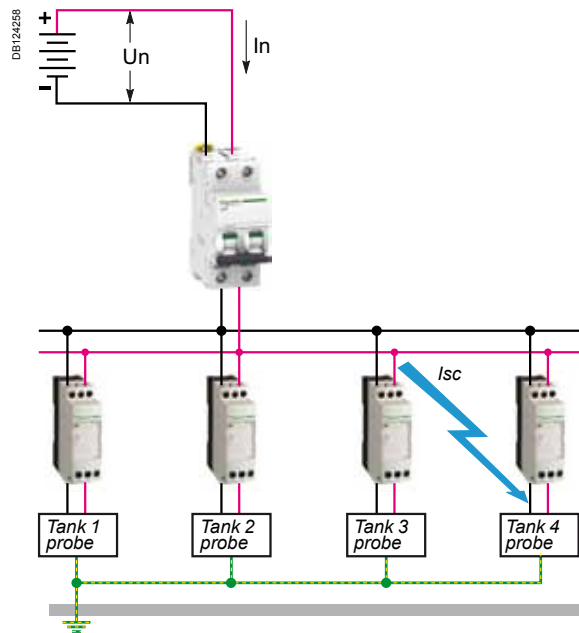

Industrial applications

Monitoring of agro-food tanks with 24 V DC converters for probes and other sensors

- Isolated network:
- $I_{sc} = 25 \text{ kA}$,
- $I_n = 40 \text{ A}$.

Solution

iC60L 2P 40 A + 24 V converters

Control of industrial process measurement by 12/24/48 V DC control

- Isolated network:
- $I_{sc} = 20 \text{ kA}$,
- $I_n = 40 \text{ A}$.

Solution

iC60H 2P 40 A + DC solid-state relays

Circuit breakers for direct current applications (cont.)

24 V - 48 V direct current applications

24 V DC generator power supply protection

- Earthed network:
- $I_{sc} = 10 \text{ kA} / I_n = 63 \text{ A}$,
- $I_{sc} = 10 \text{ kA} / I_n = 20 \text{ A}$.

Solution

iC60N 2P 63 A + iC60N 2P 20 A + DC loads

Circuit breakers for direct current applications (cont.)

24 V - 48 V direct current applications

Tertiary applications

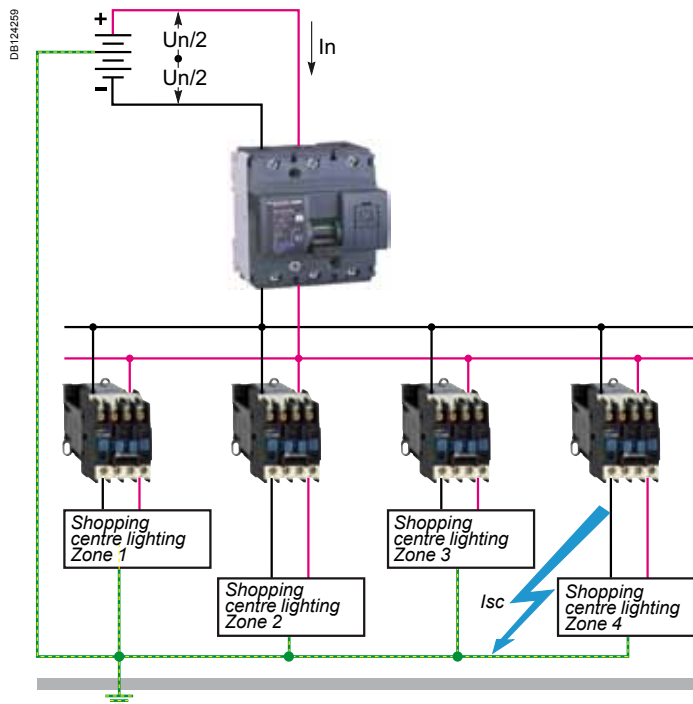

Control and monitoring of the 48 V DC emergency lighting distribution for a shopping centre

■ Mid-point of the network:

- $I_{sc} = 20 \text{ kA}$,
- $I_n = 125 \text{ A}$.

Solution

NG125H 3P 125 A + power contactors

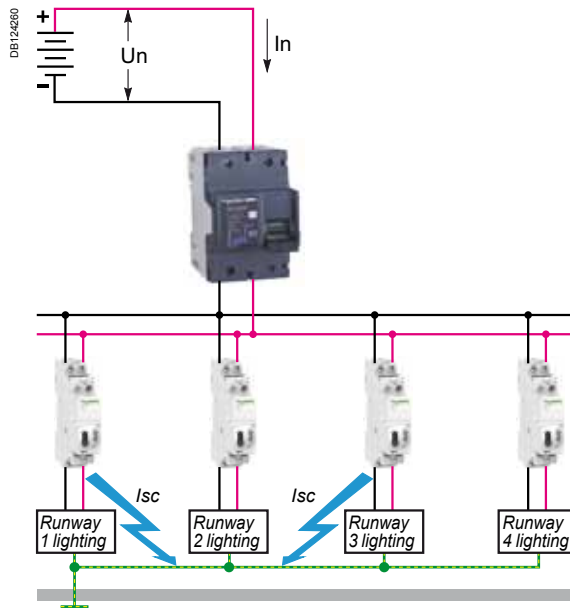

Major airport in France, 48 V DC emergency lighting for runways

■ Isolated network:

- $I_{sc} = 50 \text{ kA}$,
- $I_n = 80 \text{ A}$.

Solution

NG125L 2P 80 A + impulse relays

Circuit breakers for direct current applications (cont.)

24 V - 48 V direct current applications

Power supply protection by 24 V DC direct current generator

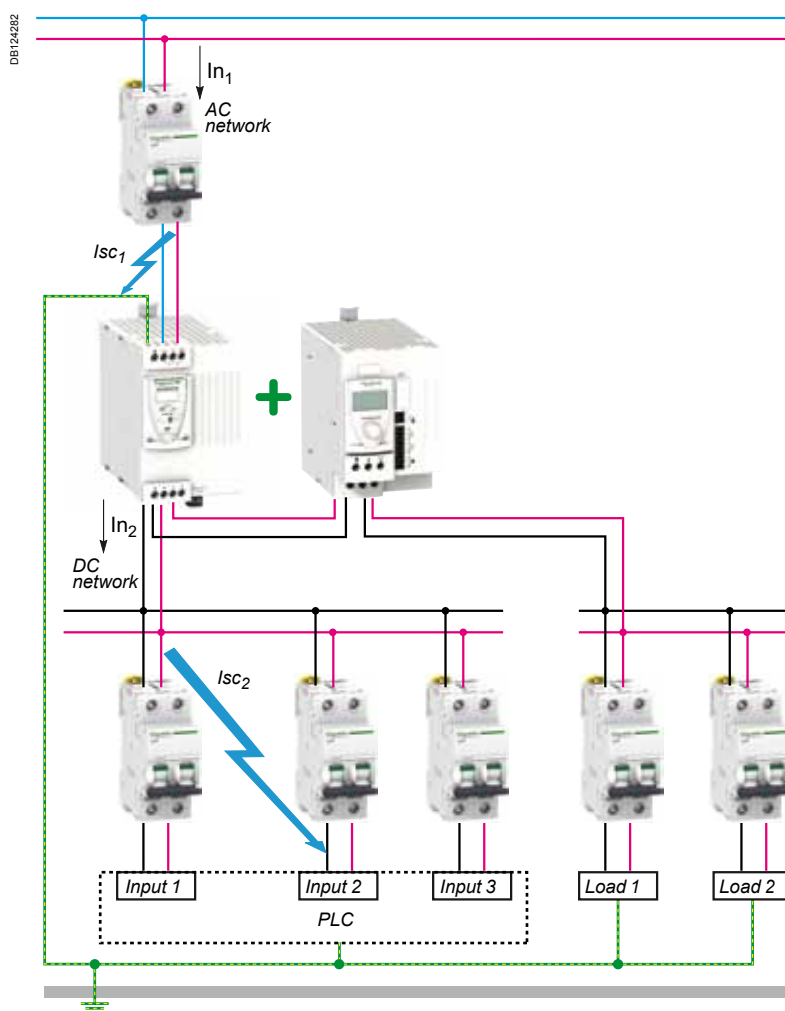

- Earthed network:
 - $I_{sc1} = 10 \text{ kA} / I_n = 40 \text{ A}$,
 - $I_{sc2} = 10 \text{ kA} / I_n = 2/4/6 \text{ A}$.

Solution

iC60N 2P 40 A + iC60N 2P 2/4/6 A + PLC inputs + DC loads

The Phaseo network failure solution provides the installation (or part thereof) with a 24 V DC power supply in the event of a mains voltage failure:

- throughout the mains failure, to ensure the continuity of service of the installation.
- during a limited time to allow:
 - data to be backed up,
 - actuators to be put in the fallback position,
 - a generating set to be started up,
 - the operating systems to be shut down,
 - remote supervision data to be transmitted.

Direct current distribution

Choosing and implementing protective devices

Complementary
technical information

This document illustrates the use of the Acti9 product range for the protection of direct current distribution applications of voltage less than 500 V.

There is also a circuit breaker offer dedicated to photovoltaic applications: C60PV-DC (low breaking capacity 1.5 kA and higher voltage 800 V).

Choice

Choosing the rating

The thermal tripping curve of a circuit breaker is the same in direct current as in alternating current (50/60 Hz). The rule for choosing is therefore the same: to ensure protection against circuit overloads, choose a circuit breaker with a rating (I_n) less than or equal to the current (I_z) allowed to pass through the cable.

Circuits with momentary current direction reversal

In the case of circuits with momentary current direction reversal:

- C60H-DC circuit breakers cannot be used
- iC60 circuit breakers can be used

Examples of circuits with momentary current direction reversal

- Paralleled energy sources (photovoltaic cells, generators, generating sets, etc.).

DBI125710

- Batteries with rectifier/charger.

DBI125711

- Motor protective devices capable of operating as a generator.

DBI125712

- Use of the C60PV-DC is specifically dedicated to photovoltaic (PV) applications (generally higher voltages with low breaking capacity).

Example: iC60, B, C, D curves, ratings from 6 A to 63 A.

Choosing the curve

The magnetic tripping threshold must be:

- higher than the inrush currents due to loads (motors, capacitors, etc.)
- lower than the short-circuit current at the installation point, which depends on:
 - the short-circuit power of the source (indicated by the manufacturer),
 - the impedance of the supply line.

In direct current:

- the short-circuit power of the sources is generally low: batteries, photovoltaic panels, generators, electronic converters, etc
- the loads generate lower inrush currents than in alternating current (e.g. motor start-up: 2 to 4 times the rated current)
- the magnetic threshold of Acti 9 circuit breakers (relative to the rated current) is higher than in alternating current.

Circuit breaker	iC60 / C120 / NG125				C60H-DC
	Z	B	C	D	C
Magnetic tripping threshold	3,4 ...5 In	4,5 ...7 In	9...14 In	14...20 In	7....10 In

➤ Generally, choose a C60H-DC circuit breaker or a B-curve iC60 circuit breaker.

Note: It may be necessary to choose a C curve or a D curve for very high inrush current applications (e.g., electronic equipment with particularly large capacitive filters).

Choosing the breaking capacity

The choice of circuit breaker with respect to the breaking capacity depends on:

- the earthing system
- the network voltage
- the short-circuit current at the installation point in question.

Note: The breaking capacities are given for a time constant (L/R) equal to 0.015 s..

Reading the tables

- Select the table according to the earthing system.
- Select the circuit breaker corresponding to the network:
 - the circuit breaker(s) to be installed is/are identified based on the rating and short-circuit current,
 - the type of connection (number of poles, position relative to the load, isolation of polarities) is indicated according to the voltage.

iC60, C120, NG125 offer

Choosing circuit breakers for distribution with earthed polarity

The following tables show the number of poles connected in series according to the DC network voltage, and the circuit breaking performance of our circuit breaker range.

Breaking capacity for a maximum voltage per pole of: 60 V DC for the iC60 offers and 125 V DC for the C120 and NG125 offers

Fault condition analysis 1

1 The figure shows a source with the negative polarity earthed.

Fault	Fault current (max.)	Voltage	Poles involved in breaking	Breaking characteristics
A, B	Isc	Un	a	Isc at Un on the poles connected to the positive polarity

Isc: presumed short-circuit current.
Un: rated network voltage.

> All the circuit-breaker poles must be on the non-earthed polarity.

Fault condition analysis 2

2 The figure shows a source with the negative polarity earthed.

Fault	Fault current (max.)	Voltage	Poles involved in breaking	Breaking characteristics
A	Isc	Un	a	Isc at Un on the poles connected to the positive polarity
B	Isc	Un	a + b	Isc at Un on all the poles connected in series
C	-	-	b	No breaking needed

Isc: presumed short-circuit current.
Un: rated network voltage.

> All the circuit-breaker poles must be on the non-earthed polarity. One pole on the earthed polarity will allow isolation to be performed.

Isolation	Number of poles and connection diagram			
	1P	2P	3P	4P
Not required ①	DB405938 	DB405939 	DB405940 	DB405941
Required ②	DB405942 	DB405943 	DB405944 	

R: Load.

iC60, C120, NG125 offer

Choosing circuit breakers for distribution with earthed mid-point

The following tables show the number of poles connected in series according to the DC network voltage, and the circuit breaking performance of our circuit breaker range.

Breaking capacity for a maximum voltage per pole of: 60 V DC for the iC60 offers and 125 V DC for the C120 and NG125 offers

Fault condition analysis

Fault	Fault current (max.)	Voltage	Poles involved in breaking	Breaking characteristics
A	I _{sc}	Un/2	a	I _{sc} at Un/2 on the poles connected to the positive polarity
B	I _{sc}	Un	a + b	I _{sc} at Un on all the poles connected in series
C	I _{sc}	Un/2	b	I _{sc} at Un/2 on the poles connected to the negative polarity

I_{sc}: presumed short-circuit current.
Un: rated network voltage.

> The circuit-breaker poles must be distributed symmetrically over the two polarities.

Obviously, this connection provides isolation.

Isolation	Number of poles and connection diagram	
Required or not	2P	4P

R: Load.

iC60, C120, NG125 offer

Choosing circuit breakers for distribution isolated from earth

The following tables show the number of poles connected in series according to the DC network voltage, and the circuit breaking performance of our circuit breaker range.

Breaking capacity for a maximum voltage per pole of: 60 V DC for the iC60 offers and 125 V DC for the C120 and NG125 offers

Fault condition analysis

The figure shows a source in IT system with a second fault (D) on the negative polarity.

Fault	Fault current (max.)	Voltage	Poles involved in breaking	Breaking characteristics
A	Low	Low	a	No breaking needed
A and D	$I_d^{(1)}$	U_n	a	I_d at U_n on the poles connected to the positive polarity
B	I_{sc}	U_n	a + b	I_{sc} at U_n on all the poles connected in series
C	Low	Low	b	No breaking needed

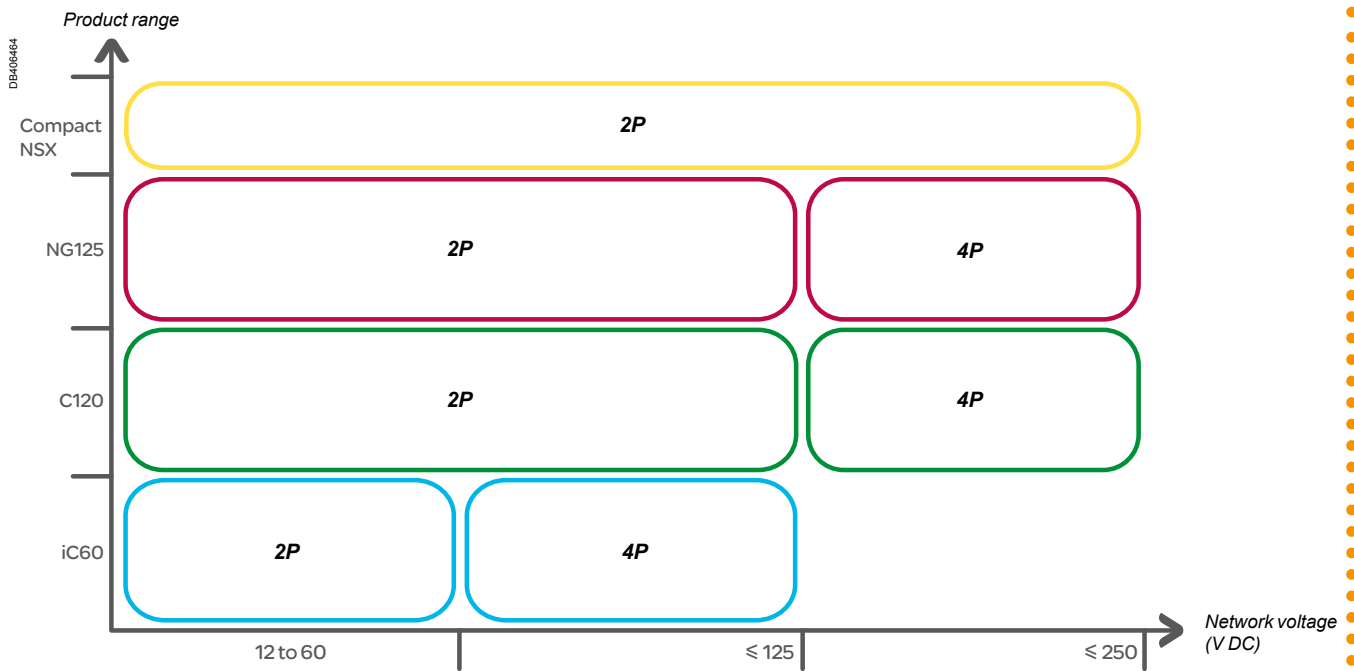

I_{sc} : presumed short-circuit current.
 U_n : rated network voltage.

(1) Fault current values acceptable according to the installation rules.

- If $I_{sc} < 10$ kA: fault current $\leq 0.15 I_{sc}$.
- If $I_{sc} > 10$ kA: fault current $\leq 0.25 I_{sc}$.

> The circuit-breaker poles must be distributed symmetrically over the two polarities.

Obviously, this connection provides isolation.

Isolation	Number of poles and connection diagram	
Required or not	2P	4P

R: Load.

Direct current distribution

Choosing and implementing circuit breakers

C60H-DC offer

Unlike the preceding offers, the C60H-DC offer comprises polarised circuit breakers reserved exclusively for direct current applications. As we saw earlier, it is therefore not compatible in the case of circuits with (even momentary) current direction reversal. The same applies to "mixed" networks operating successively in AC and DC (e.g. safety devices).

It is an offer corresponding to the C curve and ranging up to 63 A.

Choosing circuit breakers for distribution with earthed polarity

"-" polarity earthed

The figure shows a source with the negative polarity earthed.

"+" polarity earthed

The figure shows a source with the positive polarity earthed.

Fault condition analysis

Fault	Fault current (max.)	Voltage	Poles involved in breaking	Breaking characteristics
A	Low	Low	a	No breaking needed
A and D	Id ⁽¹⁾	Un	a	Id at Un on the pole connected to the positive polarity
B	Isc	Un	a + b	Isc at Un on the both poles
C	Low	Low	b	No breaking needed

Isc: presumed short-circuit current.
Un: rated network voltage.

(1) Fault current values acceptable according to the installation rules.

- If Isc < 10 kA: fault current ≤ 0.15 Isc.
- If Isc > 10 kA: fault current ≤ 0.25 Isc.

➤ The circuit-breaker poles must be distributed symmetrically over the two polarities.

Obviously, this connection provides isolation.

Connection

Series connection

In the preceding offers we extensively used the principle of series connection of products. Series connection of the poles, by dividing the voltage per pole, optimizes the circuit breaking performance for high-voltage networks.

Series connection of the poles of a circuit breaker used in direct current therefore makes it possible to:

- divide the network voltage by the number of poles
- have the rated current for each pole
- have the circuit breaker's breaking capacity for all the poles.

Direction of cabling and cable length

In the case of series connection, the direction of cabling has a major impact on the product's performance.

Usually the first product cabling method ① will be used. For special applications where there is only a single possible current direction, the second cabling method ② is preferable, especially for electrical endurance properties.

Subsequently the cable cross section and length combination should be optimized, depending on the loads. Generally, a greater length and cross section improves performance.

Rating (In)	Cross section (mm ²)	Min. shunt length (mm)
≤ 63 A	≤ 16	500
	25	200
	35	100
≤ 125 A	35	300
	50	200

Note: This table gives the minimum cable (shunt) lengths optimizing the equipment's performance according to the cable cross sections.

Clarification concerning voltage drops

Importance of allowing for voltage drops

Voltage drops are an issue that must be taken into account especially in direct current distribution due to:

- the common use of very low voltage (24, 48 or sometimes 12 V):
 - for a given resistance and current in a circuit, relative voltage drops increase as the voltage is lowered,
 - the natural voltage drop of batteries in power reserve mode, as they are discharged,
 - the criticality of the associated applications, often requiring a high level of security and continuity of service.

Cause of voltage drops

Voltage drops are caused by the sum of the resistances in series in the circuit:

- internal resistance (r) of the source
- resistance of connecting cables
- internal resistance of control and protection switchgear, often significant for circuit breakers of low rating (a few amperes) powered at very low voltage
 - it is generally expressed in mΩ
 - in the absence of data directly from the manufacturer, it can be calculated by dividing the power consumption by the square of the current: $r = P/I^2$
 - spurious resistance of connections.

Voltage drops in the circuit must be less than the rated operating tolerances of the various loads in steady-state conditions and especially at start-up (inrush current).

Table G.52.1 – Voltage drop

Type of installation	Lighting %	Other uses %
A – Low voltage installations supplied directly from a public low voltage distribution system	3	5
B – Low voltage installation supplied from private LV supply*	6	8

* As far as possible, it is recommended that voltage drop within the final circuits do not exceed those indicated in installation type A.

When the main wiring systems of the installations are longer than 100 m, these voltage drops may be increased by 0.005 % per metre of wiring system beyond 100 m, without this supplement being greater than 0.5 %.

Voltage drop is determined from the demand by the current-using equipment, applying diversity factors where applicable, or from the values of the design current of the circuits.

IEC 60364-5-52 standard.

The multipolar low rating use (< 4 A) is not suitable for very low voltage networks (< 24 V DC).

Direct current distribution

Choosing and implementing circuit breakers

Examples of choices

Example 1

In a direct current distribution system, powered by a rectifier/charger of voltage 125 V with earthed "-" polarity, which circuit breakers should be installed to protect:

- the battery outgoing feeder of permissible current $I_z = 69$ A, operating current $I_b = 55$ A, and short-circuit current 10 kA?
- a lighting outgoing feeder of permissible current $I_z = 22$ A, operating current $I_b = 18$ A, and short-circuit current 10 kA?

If the battery outgoing feeder is with momentary current direction reversal, choose an iC60 circuit breaker:

Circuit to be protected	Choice of circuit breaker	
$I_b = 55$ A, $I_z = 69$ A	Rating	$I_n = 63$ A
No high current peak	Curve	B
$U_n = 125$ V, $I_{sc} = 10$ kA, "-" earthed	Breaking capacity	iC60N
	Connection	2 poles in series on "+"
Isolation required		1 pole on "-"

➤ Choose a B-curve iC60N 3P 63 A circuit breaker with 2 poles connected to the positive polarity.

If the lighting outgoing feeder is without momentary current direction reversal, choose a C60H-DC circuit breaker:

Circuit to be protected	Choice of circuit breaker	
$I_b = 18$ A, $I_z = 22$ A	Rating	$I_n = 20$ A
No high current peak	Curve	C
$U_n = 125$ V, $I_{sc} = 10$ kA, "-" earthed	Breaking capacity	C60H-DC
	Connection	1 pole on "+"
Isolation not required		No pole on "-"

➤ Choose a C60H-DC 1P 20 A circuit breaker with 1 pole connected to positive polarity.

Example 2

In a direct current distribution system, powered by a rectifier/charger of voltage 125 V, with earthed mid-point, which circuit breakers should be installed to protect:

- the battery outgoing feeder of permissible current $I_z = 69$ A, operating current $I_b = 55$ A, and short-circuit current 20 kA?
- a lighting outgoing feeder of permissible current $I_z = 22$ A, operating current $I_b = 18$ A, and short-circuit current 20 kA?

If the battery outgoing feeder is with momentary current direction reversal, choose an iC60 circuit breaker of characteristics in compliance with the installation:

Circuit to be protected	Choice of circuit breaker	
$I_b = 55$ A, $I_z = 69$ A	Rating	$I_n = 63$ A
No high current peak	Curve	B
$U_n = 125$ V, $I_{sc} = 20$ kA, earthed mid-point	Breaking capacity	iC60H
	Connection	1 pole on "+" 1 pole on "-"
Isolation required		Provided by both poles

➤ Choose a B-curve iC60H 2P 63 A circuit breaker, connected symmetrically to the "+" and "-" polarities.

Direct current distribution

Choosing and implementing circuit breakers

If the lighting outgoing feeder is without momentary current direction reversal, choose a C60H-DC circuit breaker:

Circuit to be protected	Choice of circuit breaker	
$I_b = 18 \text{ A}$, $I_z = 22 \text{ A}$	Rating	$I_n = 20 \text{ A}$
$U_n = 125 \text{ V}$, $I_{sc} = 20 \text{ kA}$, earthed mid-point	Breaking capacity	C60H-DC
	Connection	1 pole on "+"
1 pole on "-"		
Isolation not required	Provided by both poles	

➤ Choose a C60H-DC 2P 20 A circuit breaker connected symmetrically to the "+" and "-" polarities.

Example 3

In a direct current distribution system powered by two rectifiers in parallel $U_n = 250 \text{ V}$, $I_{sc} (2 \text{ sources}) = 35 \text{ kA}$, in IT system, which circuit breakers should be installed to protect:

- the pair of rectifiers of permissible current $I_z = 69 \text{ A}$ and operating current $I_b = 55 \text{ A}$?
- a lighting outgoing feeder of permissible current $I_z = 22 \text{ A}$ and operating current $I_b = 18 \text{ A}$?

If the pair of rectifiers is with momentary current direction reversal, choose an iC60 circuit breaker:

Circuit to be protected	Choice of circuit breaker	
$I_b = 55 \text{ A}$, $I_z = 69 \text{ A}$	Rating	$I_n = 63 \text{ A}$
No high current peak	Curve	B or C (the magnetic threshold is far lower than the short-circuit current)
$U_n = 250 \text{ V}$, $I_{sc} = 35 \text{ kA}$, IT system	Breaking capacity	NG125L
	Connection	2 poles on "+"
2 poles on "-"		
Isolation required	Provided by the 4 poles	

➤ Choose an NG125L 4P 63 A circuit breaker connected symmetrically to the "+" and "-" polarities.

The lighting outgoing feeder is without momentary current direction reversal but the short-circuit current is too great to choose a C60H-DC circuit breaker.

Circuit to be protected	Choice of circuit breaker	
$I_b = 18 \text{ A}$, $I_z = 22 \text{ A}$	Rating	$I_n = 20 \text{ A}$
No high current peak	Curve	B
$U_n = 250 \text{ V}$, $I_{sc} = 35 \text{ kA}$, IT system	Breaking capacity	NG125L
	Connection	2 poles on "+"
2 poles on "-"		
Isolation not required	Provided by the 4 poles	

➤ Choose a B-curve NG125L 4P 20 A circuit breaker connected symmetrically to the two "+" and "-" polarities.

Residual current devices do not work on a direct current distribution system.

Earth leakage protection can be provided by circuit breakers or residual current circuit breakers installed on the upstream AC distribution system.

Standard IEC 60479-1 determines applicable values for the protection of users.

Residual current devices

DC networks isolated from any AC network

Residual current devices will not work with a direct current distribution system powered directly by a battery, a generating set, photovoltaic cells, etc., or a rectifier with galvanic insulation. In this case protection for users is provided by choosing a network voltage that is not dangerous and an appropriate earthing system.

Safe direct current network voltage

Environment	TN-S system		IT system
	Earthed polarity	Earthed mid-point	
Dry	100 V	200 V	100 V
Wet	50 V	100 V	50 V
Immersed	25 V	50 V	25 V

DC networks connected to an AC network

In the case of a direct current distribution system powered by an AC/DC converter (without galvanic insulation), earth leakage protection can be provided by circuit breakers or residual current circuit breakers installed on the AC network upstream of the converter.

Protection against direct contact

Earth leakage protection of high sensitivity ($I_{\Delta n} = 30 \text{ mA}$) is compulsory if certain circuits operating on direct current entail risks of barring of live parts (see installation standards). This protection system should be chosen as follows:

- type A or si (bipolar), if the converter is powered by a single-phase supply
- type B, if the converter is powered by a three-phase supply.

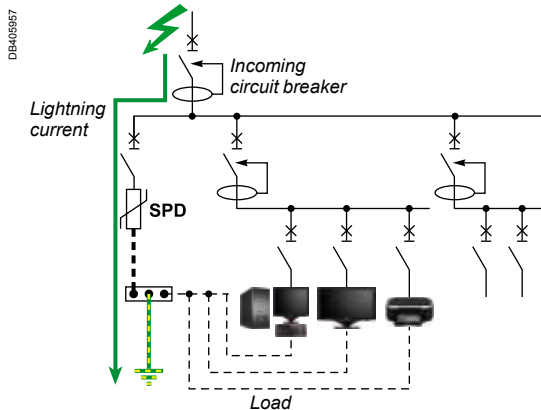

The choice of this protection system does not depend on the earthing system.

Protection against indirect contact

Protection against indirect contact		Medium-sensitivity earth leakage protection $I_{\Delta n} \geq 300 \text{ mA}$		
Upstream power supply		Three-phase		Single-phase
Characteristics of direct-current circuits to be protected		Without double insulation	With double insulation	
Upstream earthing system	TT or IT with non-interconnected exposed conductive parts	Type B	Type A	
	TN-S IT	Type A		

Fire protection

Fire protection		Medium-sensitivity earth leakage protection $I_{\Delta n} = 300 \text{ mA}$		
Upstream power supply		Single-phase or three-phase		
Characteristics of direct-current circuits to be protected		Humid or dusty environments, ancient installations and buildings		
Upstream earthing system		No influence		
		Type A		

Surge protective device

In fact the operating principle of the surge protective device remains identical in direct current; the surge protective devices capture and conduct to earth the current of electric overvoltages.

Particularly if the direct current is implemented by a rectifier without galvanic insulation and if the AC network already contains a surge protective device, there will be no need for a specific protective device.

Otherwise, the surge protective device should be adapted "finely" to the network voltage (and the overvoltage resistance of the loads, which is linked to the network voltage).

Type 3

Fine protection very close to the loads

Type 1 surge protective device

The type 1 surge protective device is recommended in the specific case of service-sector and industrial buildings, protected by a lightning rod or a meshed cage. It protects electrical installations against direct lightning strokes. It can discharge the back-current from lightning spreading from the earth conductor to the network conductors.

Type 1 surge protective devices are characterized by a 10/350 μ s current wave.

Type 2 surge protective device

The type 2 surge protective device is the main protection system for all low-voltage electrical installations. Installed in each electrical switchboard, it prevents the spread of overvoltages in the electrical installations and protects the loads.

Type 2 surge protective devices are characterized by an 8/20 μ s current wave.

Type 3 surge protective device

These surge protective devices have a low discharge capacity. They must therefore mandatorily be installed as a supplement to type 2 surge protective devices and in the vicinity of sensitive loads.

Type 3 surge protective devices are characterized by a combination of voltage waves (1.2/50 μ s) and current waves (8/20 μ s).

Generally the direct current switching voltage should be assigned a coefficient of $\sqrt{2}$ compared with alternating current. Apart from this the principle for choosing devices according to the networks remains the same.

Network voltage	Comments	Offer
24 / 48 V	Communication	iPRI
< 200 V	Communication	iPRC
200 to 400 V	Type 2 and 3	iPRD, iPF
200 to 400 V	Type 1 and 2	iPRF1, PRD1
200 to 400 V	Type 1	PRD1 Master, PRF1 Master
600 or 1000 V	PV applications	iPRD-DC

Coordination with disconnectors

A study is underway on the coordination of our surge protective devices on direct current networks; it will enable this document to be supplemented at a later stage.

DE400800

Table 6 – Equipment having a nominal voltage below 120 V a.c. or below 750 V d.c.

DC		AC	
Nominal values		Nominal values	
Preferred V	Supplementary V	Preferred V	Supplementary V
6	2,4	6	5
	3		
	4		
	4,5		
	5		
12	7,5	12	15
	9		
24	15	24	
36	30		36
48	40	48	
60	80	60	100
72			
96			
110	125	110	
220	250		
440	600		

NOTE 1 Because the voltage of the primary and secondary cells is below 2,4 V, and the choice of the type of cell to be used in various applications will be based on properties other than the voltage, these values are not included in the table. The relevant IEC technical committees may specify types of cells and related voltages for specific applications.

NOTE 2 It is recognized that for technical and economic reasons, additional voltages may be required for certain specific fields of application.

IEC 60038 standard.

The installation rules of the IEC 60364 standard apply to direct current distribution systems.

Network voltage

24 V, 48 V, 60 V, 125 V, 250 V, 500 V, 750 V.

These voltages often depend on the application or the sources used, for example:

- batteries on single-phase DC charger: voltage 240 V DC,
- batteries on three-phase DC charger: voltage 440 V DC.

Overcurrent protection

Short-circuit current

The short-circuit current depends on the source. For a distribution system powered by a battery, it can be calculated by the formula $I_{sc} \text{ (in A)} = kC$ with:

- C the battery capacity in Ah,
- k a coefficient close to 10 and in any case always less than 20.

Example

A 125 V battery of capacity 220 Ah delivers a short-circuit current I_{sc} between 2.2 kA and 4.4 kA.

Note: Since the I_{sc} current value is relatively low and the distribution system is not very extensive, the maximum short-circuit current I_{sc} at any point of the installation is taken as equal to the short-circuit current I_{sc} of the source (value by excess).

Overload protection

For a load of operating current I_b and a duct of permissible current I_z , the duct protection by a distribution circuit breaker must have a rating I_n such that: $I_b \leq I_n \leq I_z$.

Short-circuit protection

The installation standards impose no particular constraint: a magnetic tripping threshold I_m such that $5 I_n \leq I_m \leq 10 I_n$ is generally advisable.

Appendix 1

iC60, C120, NG125 offer

Choosing circuit breakers for distribution with earthed polarity

The following tables show the number of poles connected in series according to the DC network voltage, and the circuit breaking performance of our circuit breaker range.

Breaking capacity for a maximum voltage per pole of: 72 V DC for the iC60 offers and 144 V DC for the C120 and NG125 offers

Fault condition analysis, see page 728.

Isolation, number of poles and connection diagram, see page 729.

overload protection

IEC 60947-4-1

Types of co-ordination

Standard IEC 60947.4 defines tests at various current levels with the aim of placing the switchgear in extreme conditions. According to the state of components after testing, the standard defines 2 types of coordination.

■ Type 1:

Deterioration of the contactor and relay is accepted under 2 conditions:

- there is no risk for the operator,
- parts other than the contactor and relay must not be damaged.

■ Type 2:

Welding of the contactor or starter contacts is accepted only if they can easily be separated:

- after type 2 coordination tests, the functions of the protection and control switchgear are operational.

Which type to choose?

The choice of coordination type depends on the operating parameters. It must be suitable for the user's needs and ensure optimised cost of the installation.

■ Type 1:

- qualified maintenance service,
- reduced volume and cost of switchgear,
- continuity of supply not required or ensured by replacing the faulty motor rack.

■ Type 2:

- continuity of supply vital,
- reduced maintenance service,
- specifications stipulating type 2.

The various thermal relay classes: the thermal relay class must be appropriate for the motor starting time.

Classes	Tripping time at 7.2 I _r (s)
10/10 A	2 to 10
20	6 to 20

Type 1 of co-ordination

- Starting: normal (Class 10).
- Breaking performance: equal to the breaking capacity of the circuit breaker only.
- Temperature: 40°C.

(1) 480 V Nema.

The examples of photovoltaic installation architectures presented in this document illustrate the use of direct current circuit breakers dedicated to protection of the modules and cables of the PV strings, to protect against overloads and short circuits. To ensure the safety of the photovoltaic installation it is necessary, in the cases described below, to combine the C60PV-DC circuit breaker with other protective or fault detection devices on the DC side.

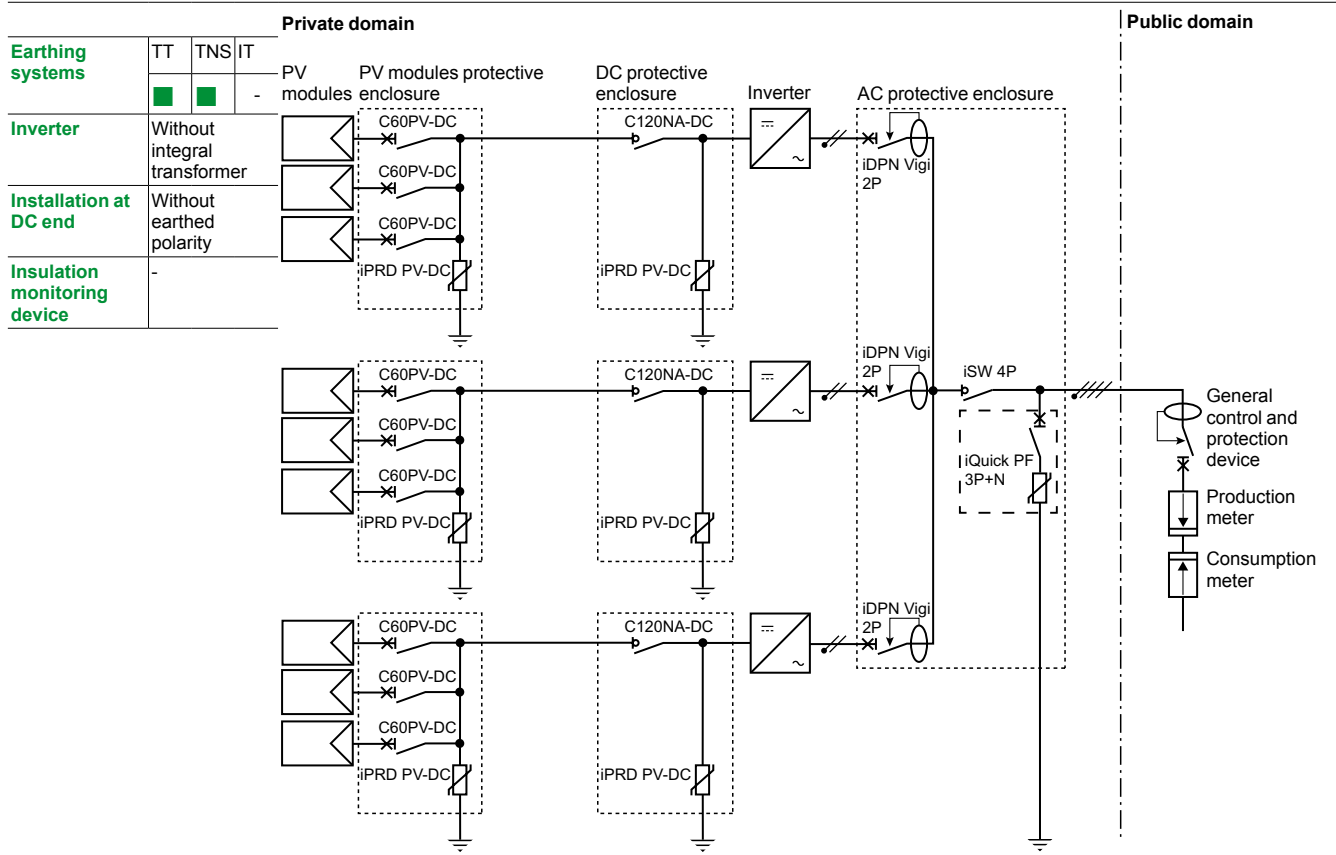

Installation from 10 to 100 kW - $U_e \leq 800$ V DC

In the case of a PV architecture without an earthed polarity on the DC side and with a PV inverter without galvanic isolation, it is necessary to:

- protect each string of photovoltaic modules with a C60PV-DC installed in the junction box near the PV modules
 - add a residual current device on the AC side of the PV inverter so that the latter trips as soon as an earth fault occurs on the DC side.
- It is necessary to intervene immediately on the site at the first default.**

Restarting will be possible only after eliminating the fault.

DE408329

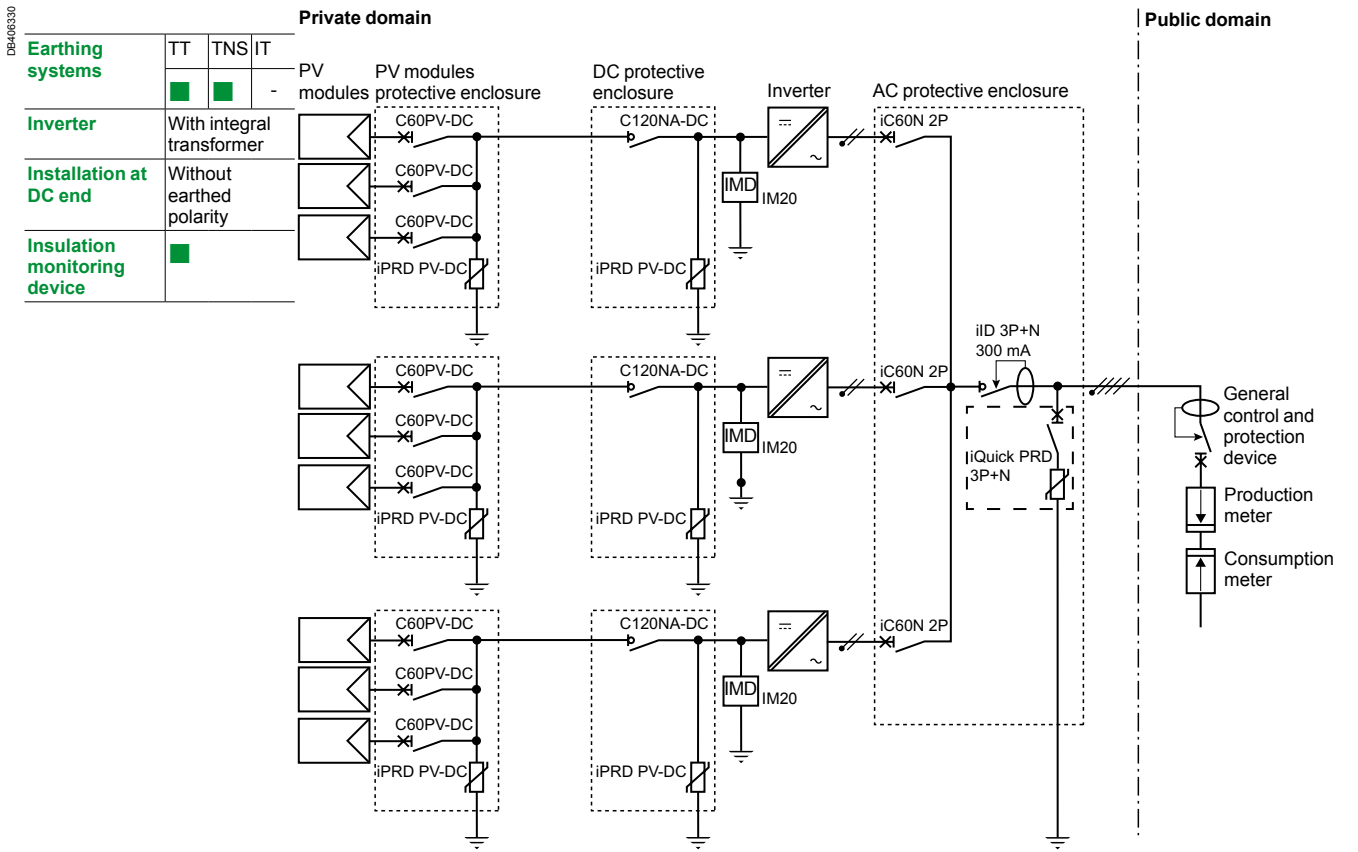

Installation from 10 to 100 kW - $U_e \leq 800$ V DC

In the case of a PV architecture without an earthed polarity on the DC side and with a PV inverter or with galvanic isolation, it is necessary to:

- protect each string of photovoltaic modules with a C60PV-DC installed in the junction box near the PV modules;
- add an insulation monitoring device on the DC side of the PV inverter in order to indicate a first earth fault and actuate stoppage of the inverter as soon as it occurs.

It is necessary to intervene immediately on the site at the first default.

Restarting will be possible only after eliminating the fault.

Installation from 10 to 100 kW - $U_e \leq 800$ V DC

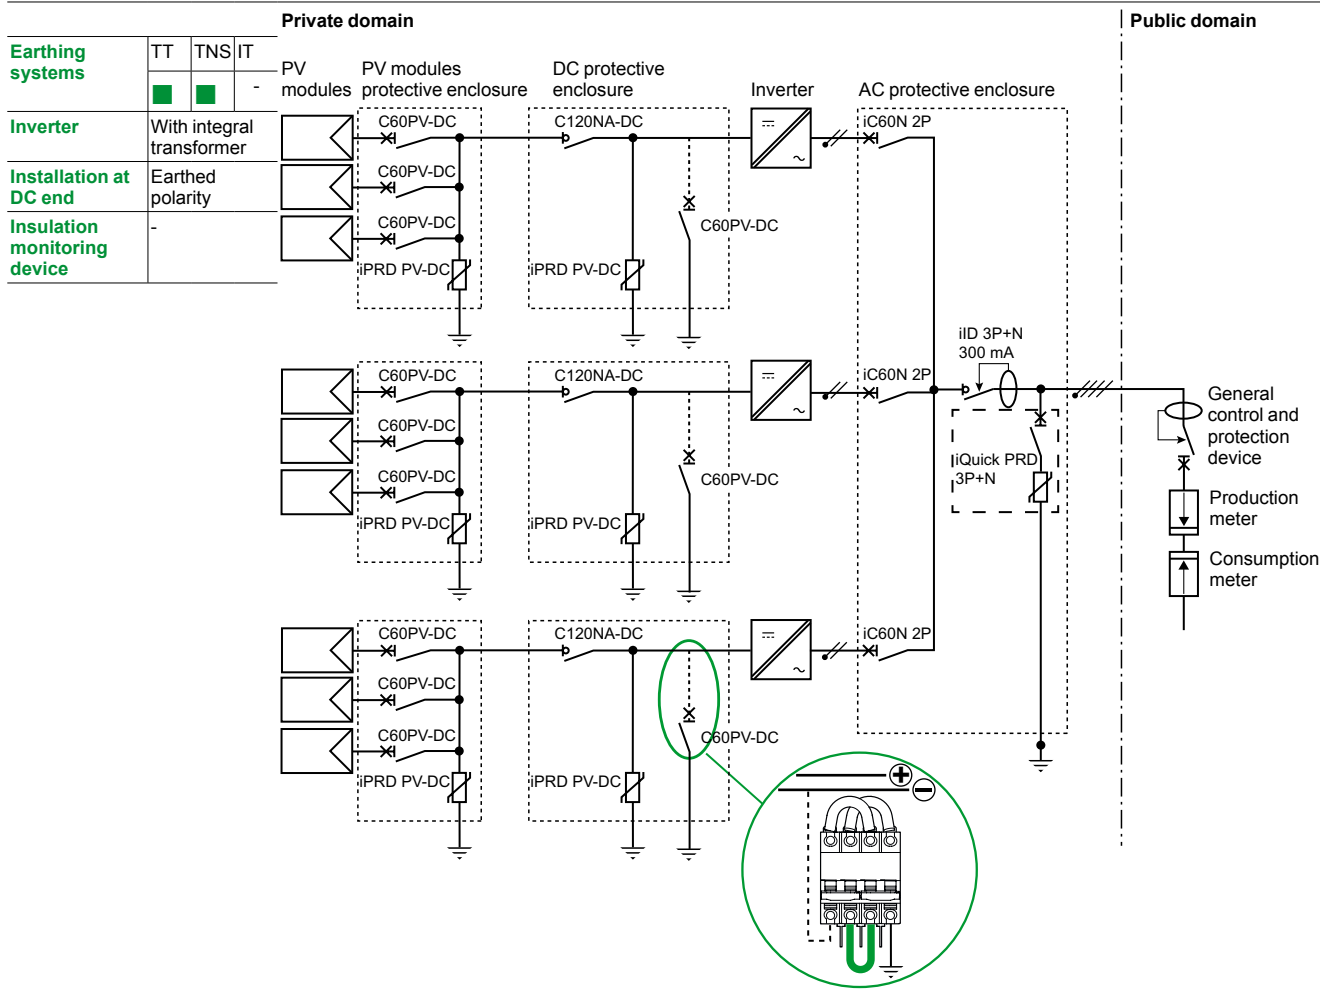

In the case of a **PV architecture with an earthed polarity on the DC side and with a PV inverter having galvanic isolation**, it is necessary to:

- protect each string of photovoltaic modules with a C60PV-DC installed in the junction box near the PV modules
- add a C60PV-DC earth protection circuit breaker, with all poles in series, on the DC side of the PV inverter.

PV inverter stoppage is actuated via an auxiliary contact combined with the earth protection circuit breaker. Polarity earthing and the protective device should not be implemented if the PV inverter already has an earthed polarity.

It is necessary to intervene immediately on the site at the first default.
Restarting will be possible only after eliminating the fault.

DE408331

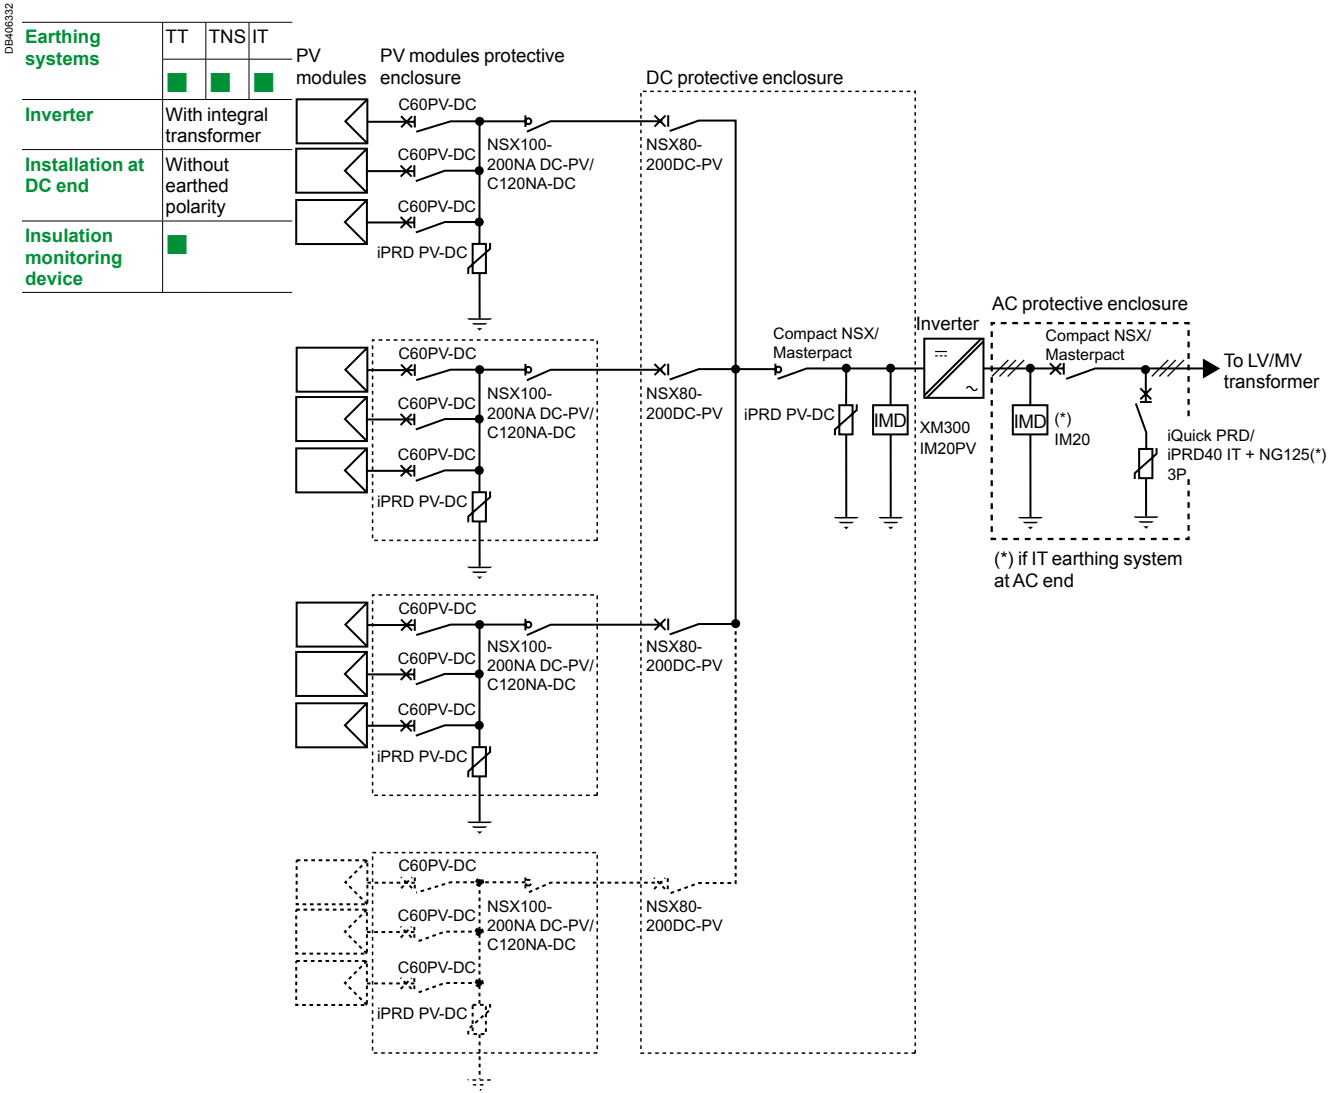

Installation > 100 kW - U_e ≤ 800 V DC

In the case of a PV architecture without an earthed polarity on the DC side and a central PV inverter having galvanic isolation, it is necessary to:

- protect each string of photovoltaic modules with a C60PV-DC installed in the protection cabinet for the PV strings located near the PV modules
- add an insulation monitoring device (IMD) on the DC side of the PV inverter (and on the AC side if IT earthing system on AC side) in order to indicate a first earth fault and actuate stoppage of the PV inverter as soon as it occurs.

It is necessary to intervene immediately on the site at the first default.
Restarting will be possible only after eliminating the fault.

Installations > 100 kW - $U_e \leq 800$ V DC

In the case of a PV architecture with an earthed polarity on the DC side and a central inverter having galvanic isolation and an IT earthing system on the AC side, it is necessary to:

- protect each string of photovoltaic modules with a C60PV-DC installed in the protection cabinet for the PV strings located near the PV modules
- add a C60PV-DC earth protection circuit breaker, with all poles in series, on the DC side of the PV inverter.

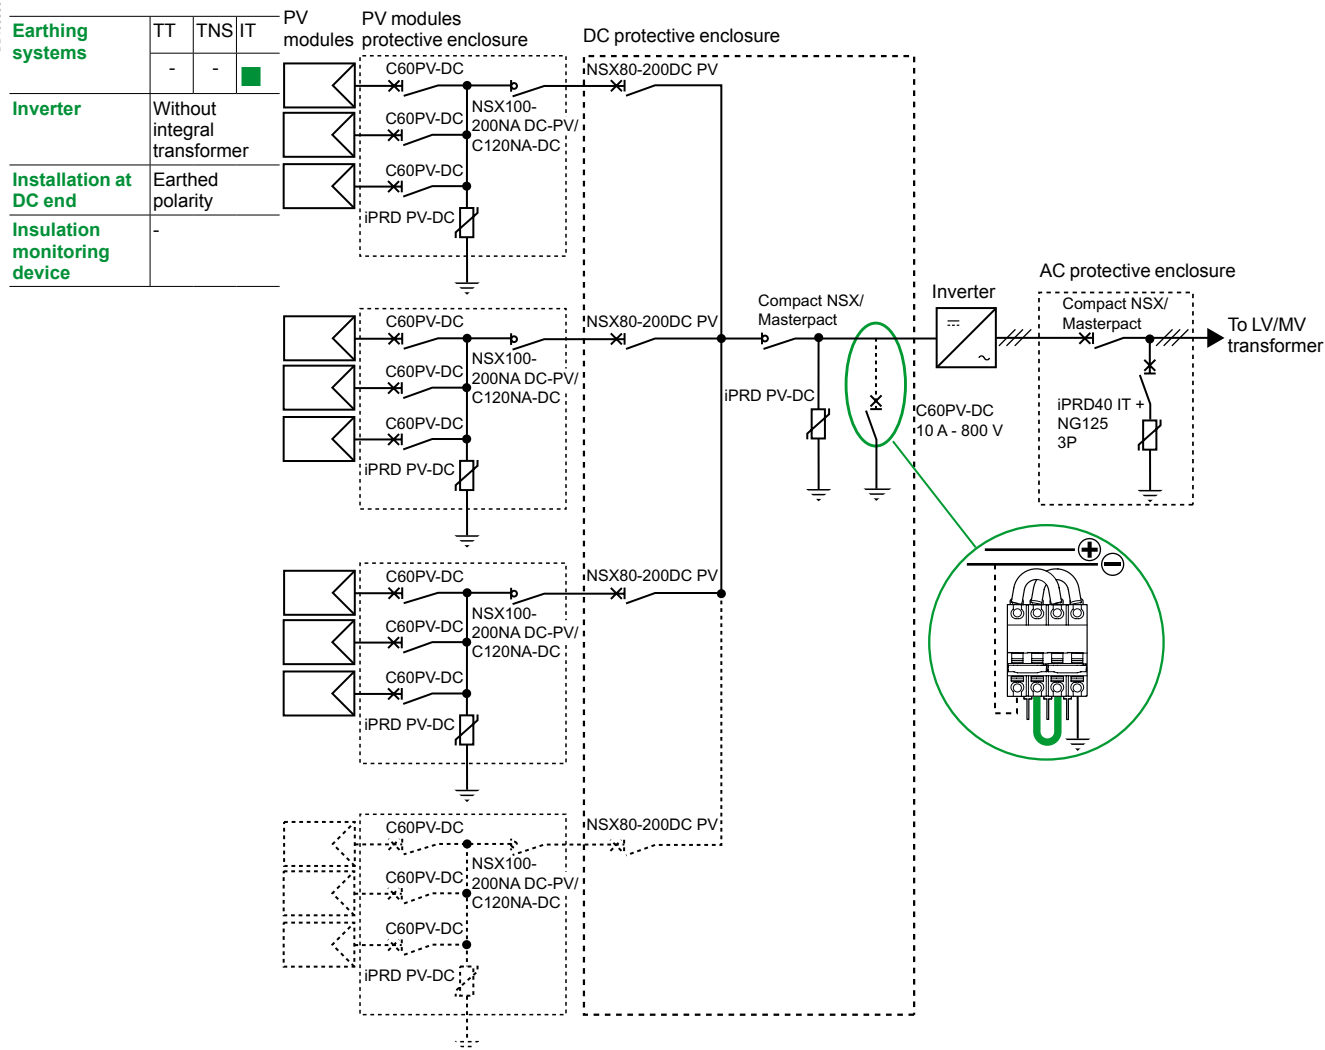

PV inverter stoppage is actuated via an auxiliary contact combined with the earth protection circuit breaker. Polarity earthing and the protective device should not be implemented if the PV inverter already has an earthed polarity.

If the Isc of the DC installation exceeds 1.5 kA, replace the C60PV-DC earth protection circuit breaker with an NSX80 DC PV provided with a 16 A release.

It is necessary to intervene immediately on the site at the first default.

Restarting will be possible only after eliminating the fault.

Examples of using C120NA-DC switch-disconnector Architectures

10 kW-100 kW grid-connected PV system (small buildings)

Three-phase multi-input inverter without array box

Typically, 10 kW to 36 kW grid-connected inverters with $U_{OC,MAX}$ probably higher than 600 V (i.e. 800 V or 1000 V) and $I_{SCTC} < 125 A$, $I_{AC} < 63 A$. In this range of power, inverters usually have between 2 and 4 maximum power point tracking (MPPT) inputs, so the number of strings in the same DC sub-network is equal to one or two. There is no need for string protection. A PV main switch for each MPPT input is necessary. When an inverter is indoors, additional remote-controlled switches at DC cable entry point are recommended for emergency services.

	String junction box	PV main switch
Needs	Switchgears and control	
Isolation	■	■ (b)
Switching (making and breaking rated current)	■ DC21B	■ (b) DC21B
Control	■ (a)	■ (b)
Schneider Electric offer	"Q1" C60NA-DC + MX / MN or C120NA-DC + MX / MN	"Q2" INS PV or C60NA-DC or C120NA-DC

(a) Remote switching for emergency services located as closely as possible to the PV modules or to the point of entry of DC cables in the building.
 (b) Service and emergency switching.

- If the inverter provides at least simple separation:
 - without functional earthing: insulation monitoring is necessary, it's usually done by the inverter in this range of power
 - with functional earthing: the earthing shall be done with a DC MCB breaker (C60PV 4P series 2 – 10 A) or a fuse.

Examples of using C120NA-DC switch-disconnector Architectures (cont.)

10 kW-100 kW grid-connected PV system (small buildings)

Three-phase inverter with one array box

Typically, 30 kW to 60 kW grid-connected inverters. $U_{OC,MAX}$ is generally higher than 600 V (up to 1000 V), I_{SCTC} does not exceed 200 A, I_{AC} does not exceed 100 A. This design has more than 2 strings. Reverse current protection is therefore necessary. A main PV switch is required. When an inverter is inside, additional remote-controlled switches at DC cable entry point are recommended for emergencies.

For back panel

Residual current devices are vital for the safety of people.

That is why:

- the electrical installation operation and maintenance standards require these protection devices to be tested at regular intervals,
 - les the product standards IEC 61008 and IEC 61009 require such devices to be fitted with a test button (marked "T") on the front panel.
- The user can therefore check and be certain that the device is working correctly.

The test button provides reliable information about how the device is working: tripping as soon as the button is pressed guarantees that the protection is working properly. If the device fails to trip, it must be examined to determine the cause of this malfunction.

Example iLD

Example Vigi iC60

Test frequency

The residual current devices must be tested as frequently as required by the installation regulations and/or the safety regulations currently in force.

In the absence of any regulations, Schneider Electric recommends the test to be carried out:

- after initial connection and any subsequent reconnection,
- every years, for devices recently installed in good environmental conditions (no dust, corrosion, humidity, etc.),
- every 3 months, for devices that have been in use for seven years or more in good environmental conditions,
- every months, for devices used in corrosive or harsh environmental conditions or highly exposed to lightning strikes.

Procedure

<p>The residual current device is powered on and the loads are connected.</p>	<p>Briefly press the test button marked "T" on the front panel.</p> <p> Pressing the test button too long can seriously damage the device.</p>	<p>The residual current device should trip instantly. If it fails to trip, the additional checks described below should be performed.</p>	<p>When the test is finished, put the residual current device back into service.</p>
			

Failure to trip during the test

Failure to trip during the test is often due to a cause that is external to the residual current device.

The table below shows the possible causes, the additional checks and tests to be carried out and the corrective actions to be taken, depending on the results. After a corrective action has been performed, repeat the test until a correct result is obtained.

Cause of the malfunction			
Network frequency	Network voltage	Connection (three-pole or four-pole device)	Load leakage currents
Additional test			
Check that the network frequency is the same as the frequency read on the device.	Check that the mains voltage is the same as that indicated on the front face of the device.	Measure the voltage between terminals: <ul style="list-style-type: none"> ■ 3 and 6 for iID ■ 4 and 6 for Vigi iC60. This voltage must be between 85 % and 110 % of the voltage indicated on the device ⁽¹⁾ .	Disconnect the loads and press the test button again.
		 iID	
		 Vigi iC60	
Incorrect test result			
If the network frequency is different, the button test is not significant.	<ul style="list-style-type: none"> ■ If the voltage measured is less than 85 % of that indicated on the device, the test button may not work, although the protection device will continue to function ⁽¹⁾. ■ If the voltage measured is more than 110 % of the voltage indicated on the device there is a risk that the device will be destroyed. 	The incorrect voltage may be due to a connection error (e.g. phase/neutral inversion/missing phase, etc.). The Acti 9 three-pole and four-pole residual current devices cannot be used on single-phase circuits. The Acti 9 four-pole residual current devices can be used normally on three-phase circuits without neutral.	If the device trips, the earth leakage protection is working correctly.
Corrective actions			
The device must be checked by an external device (see below).	If the voltage measured is different from the rated voltage of the mains, look for the problem on the power supply or on the downstream circuits (lines, loads): <ul style="list-style-type: none"> ■ if the rated voltage of the mains is lower than that indicated on the device it must be replaced by a device with a suitable rated voltage the next time it is shut down ■ if the rated voltage of the mains is higher than the voltage indicated on the device it must immediately be replaced by a device with a suitable rated voltage. 	Modify the connection to obtain the rated voltage (phase-phase) between terminals.	Measure the permanent leakage current of each load. <ul style="list-style-type: none"> ■ in the event of abnormal load leakage, correct the insulation fault. ■ otherwise, separate the circuits to reduce the permanent leakage currents seen by each residual current device.

⁽¹⁾ In most cases, the test button on the Acti 9 residual current devices functions at down to 50 % of the rated voltage.

If none of the additional tests indicate a fault, the residual current device is faulty. Checking with an external device (see below) will show whether or not it has to be replaced urgently.

Test result	Positive	Negative
Diagnosis	<ul style="list-style-type: none"> ■ the earth leakage protection device is working properly ■ the test circuit is faulty 	Earth leakage protection is not working
Corrective actions		
	The residual current device must be replaced quickly (as soon as it is no longer being used).	 The residual current device must be replaced immediately

Some tertiary and industrial installation safety regulations require residual current devices to be checked with a specific device.

Checking with a specific test device

For the tests performed to be valid, these devices must comply with IEC 61557-6.

These devices are used to check:

- the operating voltage
- the tripping threshold (according to the sensitivity $I_{\Delta n}$) of the residual current device
- the tripping times at $I_{\Delta n}$, $2 \times I_{\Delta n}$, $5 \times I_{\Delta n}$, etc. The normal values are shown on pages CT6-1 and CT6-4.

With an IT earthing system (isolated neutral), a first insulation fault should be created artificially to allow a fault current to circulate during the tests.

Procedure

- Disconnect the fixed and mobile loads (if the residual current device protects the power outlets).
- Connect the test device to the downstream terminals of the residual current device or to a downstream power outlet.

Earth leakage protection

Response time of high-sensitivity residual current devices

All the high-sensitivity residual current devices (30 mA) in the Acti 9 range conform to the IEC/EN 61008 and IEC/EN 61009 standards. The response times defined by these standards guarantee their effectiveness in protecting people against direct contacts.

Response time

The response time of a residual current device is the time between the appearance of a dangerous leakage current and the interruption of the circuit.

For a residual current device with a sensitivity of $I_{\Delta n}$ 30 mA:

Fault current (mA)		Maximum response time (ms)
$I_{\Delta n}/2$	15 mA	No tripping
$I_{\Delta n}$	30 mA	300 ms
$2 \times I_{\Delta n}$	60 mA	150 ms
$5 \times I_{\Delta n}$	150 mA	40 ms

These response times conform to the specifications of the IEC/EN 61008 and IEC/EN 61009 standards.

They guarantee protection of people against direct contacts for the following reasons :

- When a person comes into direct contact with a live conductor, the current passes directly through the human body.
- This current, with the same magnitude, is detected by the residual current device.

■ The IEC 60479 technical report studies the sensitivity of the human body to the electric current. Curve c1 defines for each current value the maximum time before the current causes injury to a person.

■ Superimposing the two curves shows that the above response times protects the users.

Measuring the response time

If the user wishes to check the response time of his residual current devices, he should follow a specific procedure to:

- establish a leakage current of calibrated magnitude
- measure the exact response time.

Procedure

The measuring instruments must conform to IEC/EN 61557-6.

Carry out the operations in the following order according to the safety instructions:

- disconnect the loads
- install the measuring instrument downstream of the residual current device to be tested (for example on a power outlet)
- perform the measurement.

Earth leakage protection

Response time of medium-sensitivity residual current devices

Response time of iC60 Vigi and iLD60 residual current devices

The medium-sensitivity residual current devices (100...1000 mA) in the Acti 9 range conform to IEC/EN 61008 and 61009:

- their response time guarantees personal protection against indirect contacts and fire risks
- in the case of selective versions (S), a "non-tripping time" guarantees discrimination with the residual current devices installed downstream.

Instantaneous residual current devices

		Sensitivity (I Δ n)			
		100 mA	300 mA	500 mA	
Fault current (mA)	I Δ n/2	50	150	250	No tripping
					Max. response time
	I Δ n	100	300	500	300 ms
	2 x I Δ n	200	600	1000	150 ms
	5 x I Δ n	500	1500	2500	40 ms
500 A					40 ms

Selective (S) and time-delayed (R) residual current devices

Residual current device	Sensitivity (I Δ n)				Type				
	100 mA	300 mA	500 mA	1000 mA	Selective (S)		Time-delayed (R)		
Fault current (mA)	I Δ n/2	50	150	250	500	No tripping		No tripping	
						Non-tripping time	Response time	Non-tripping time	Response time
	I Δ n	100	300	500	1000	130 ms	500 ms	300 ms	1000 ms
	2 x I Δ n	200	600	1000	2000	60 ms	200 ms	150 ms	500 ms
	5 x I Δ n	500	1500	2500	5000	50 ms	150 ms	150 ms	300 ms
500 A					40 ms	150 ms	150 ms	300 ms	

Definitions

Response time

Time between the appearance of a hazardous leakage current and circuit power down.

Non-tripping time

For selective and time-delayed devices, the non-tripping time is the time between the appearance of a hazardous leakage current and the device tripping.

If the leakage current disappears before this time, the device does not trip.

This fast disappearance of the leakage current can be due to:

- the transient nature of the fault (e.g. the current generated by a switching surge)
- the interruption of the fault current by another faster residual current device situated downstream.

Selective and time-delayed devices therefore afford the user:

- better immunity against nuisance tripping
- total discrimination between residual current devices.

Earth leakage protection

Response time of medium-sensitivity residual current devices

Protection against indirect contacts

The response times of residual current devices guarantee personal protection against indirect contacts, in conformance with the requirements of the installation standards (IEC 60364 or equivalent).

Indirect contacts

A person who comes into contact with an accidentally live frame caused by an insulation fault experiences an indirect contact: the contact voltage U_c creates a current that passes through the human body.

Maximum breaking time

The maximum breaking time required by the installation standards, in the event of an insulation fault, depends on:

- the network voltage
- the earthing system.

Maximum breaking time for terminating circuits (ms)

Earthing system	Network phase/neutral voltage			
	50...120V	120...230V	230...400V	> 400 V
TN or IT	800	400	200	100
TT	300	200	70	40

Note: a breaking time of no more than 5 s is permitted for distribution circuits to ensure discrimination with the devices installed on the terminating circuits. This time should be reduced to the essential minimum.

These times are based on the maximum prospective values of the contact voltage U_c and on the contact times authorised by technical report IEC 60479.

Example

On a three-phase phase/neutral voltage network $U_o = 230\text{ V}$ in a TT system:

- the resistance of the neutral earth connection R_n is $10\ \Omega$,
- the resistance of the operating frame earth connection R_A is $100\ \Omega$.

In the event of an insulation fault, the leakage current I_d is equal to: $U_o / (R_A + R_n)$ i.e. $230\text{ V} / 110\ \Omega = 2.1\text{ A}$.

The contact voltage U_c is therefore $I_d \times R_A$ i.e. $2.1\text{ A} \times 100\ \Omega = 210\text{ V}$.

■ Protection sensitivity

The residual current device must trip as soon as the leakage current corresponds to a hazardous situation, i.e. a contact voltage of 50 V (in a dry atmosphere). Hence, $I_{\Delta n} = 50\text{ V} / R_A$, i.e. $50\text{ V} / 100\ \Omega = 500\text{ mA}$.

■ Maximum breaking time

For a 230 V phase/neutral voltage network in a TT system, the IEC 60364 standard requires a maximum breaking time of 200 ms .

For the 2.1 A leakage current:

- an instantaneous residual current device with a sensitivity of 300 mA will power down the circuit in less than 40 ms ,
- an instantaneous residual current device with a sensitivity of 500 mA will power down the circuit in less than 60 ms .

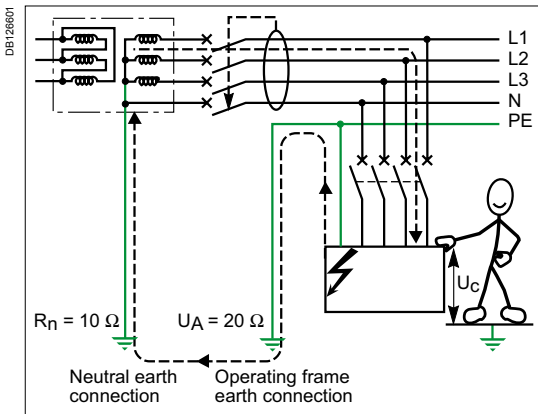

Note: For well-designed and regularly maintained electrical installations, the resistance of the operating frame earth connection can be less than $100\ \Omega$.

Use of the time-delayed residual current devices

In accordance with the breaking times required by the installation standards (above), the selective and time-delayed residual current devices can be used in the following cases:

Circuit	Network voltage (phase/neutral)	Residual current device		
		Instantaneous I	Selective S	Time-delayed R
Terminating circuit	$\leq 230\text{ V}$	■	■	(1)
	$> 230\text{ V}$	■		
Sub-distribution or general		■	■	■

(1) Only in a TN system for a phase/neutral voltage $< 120\text{ V}$.

The response times of residual current devices with a sensitivity of 300 mA guarantee protection against fires generated by leakage currents

Protection against fire hazards

Most fires of electrical origin are caused by the creation and propagation of electric arcs in building materials, in the presence of moisture, dust, pollution, etc. These arcs appear and develop due to the wear and tear or ageing of the insulating materials. The fire risk occurs when the leakage currents reach a few hundred milliamps for a few seconds.

For fault currents of this magnitude, residual current devices with a sensitivity of 300 or 500 mA trip in less than a second, whether they be instantaneous, selective or time-delayed.

IEC 60364-4-42 (subclause 422.3.10) states that it is mandatory to install a residual current device with a sensitivity less than or equal to 500 mA:

- on premises with a risk of explosion (BE3)
- on premises with a risk of fire (BE2)
- in agricultural and horticultural buildings
- for circuits supplying fair, exhibition and entertainment equipment
- on temporary outdoor leisure facilities.

In certain countries, the installation rules and/or local safety regulations require a sensitivity of 300 mA.

Earth leakage protection

Response time of medium-sensitivity residual current devices

Discrimination of residual current devices

The non-tripping times of type (S) and (R) residual current devices ensure discrimination with the residual current devices located downstream.

Combination rules

To ensure discrimination between two cascading residual current devices, the following two conditions must be met simultaneously:

- the sensitivity of the upstream device must be at least 3 times the sensitivity of the downstream residual current device
- the upstream residual current device must be one of the following types:
 - Selective (S) if the downstream residual current device is instantaneous,
 - Time-delayed (R) if the downstream residual current device is selective (S).

The figure below shows how compliance with these rules provides discrimination on three levels: whatever the value of the fault current, it will be interrupted by the device situated immediately upstream of the fault and only by this device.

Example:

In the above diagram for a fault current of 1000 mA:

- if the fault occurs downstream of the 30 mA residual current device, the latter will interrupt the current in less than 40 ms, whereas type S and R devices "wait" for 80 ms and 200 ms respectively. Therefore, neither of the two devices trips.
- if the fault occurs downstream of the type S residual current device, the latter will interrupt the current in less than 175 ms, whereas the type R device "wait" for 200 ms and therefore does not trip.

If these cascading combination rules are complied with, the level of continuity of service provided to the user depends on the way in which the "horizontal discrimination" is implemented: the terminal feeders must be divided into as many circuits as necessary, each protected by a residual current device.

Some types of electrical and electromagnetic interference caused by the network or its environment may affect the operation of earth leakage protection devices and result in:

- **Nuisance tripping** (tripping in a non-dangerous situation). Such tripping is often repetitive, which is highly detrimental to satisfying the user's energy requirements.
- **Risk of non-tripping** in dangerous situations. This risk must be carefully analysed, because it affects people's safety. The standards define three categories of earth leakage protection devices according to their ability to control these types of situation.

- The risk of interference must be taken into account when selecting earth leakage protection devices (see module CA902000), according to the loads supplied and the environment.

- The explanations given below specify the main types of interference, their origin and how Schneider Electric's earth leakage protection devices respond, according to their type.

Nuisance tripping

This type of tripping is caused by the combination of two factors:

- A transient or continuous high-frequency voltage that is superimposed on the normal network voltage (50 Hz).
 - The presence of capacitors between the electrical network and the earth (or frames). As these capacitors are exposed to a high-frequency voltage, a current which can trip an earth leakage protection device flows to earth.
- The causes, duration and frequency spectra of such interference, which is often difficult to identify, can vary greatly, as shown in the examples below.

High-frequency harmonics

The current absorbed by non-linear loads such as IT equipment power supplies, frequency converters, variable speed drive motor controls, electronic ballast lights, etc. includes high-order harmonics.

If the natural capacitances of the protected circuit are significant (between the cables and earth, or between the live parts of the devices and their frames), earth leakage protection devices may be tripped, although no danger is present.

This risk of nuisance tripping is all the more likely to occur when a large number of identical loads are supplied in parallel and protected by the same earth leakage protection device.

Low-frequency continuous leakage currents

These leakage currents are mainly generated by the filtering capacitors in the power supply stage of electronic devices. Depending on the number of devices protected by the same earth leakage protection device, these leakage currents may:

- Increase the risk of tripping in the event of high-frequency interference.
- Cause frequent tripping

To guarantee satisfactory operation, these continuous leakage currents must not exceed 25% of the sensitivity ($I_{\Delta n}$) of the earth leakage protection device, by limiting the number of "interfering" loads protected by the same earth leakage protection device.

- If more accurate data is unavailable, the leakage current can be estimated on the following basis, for a 230 V, 50 Hz network:

- heating floor: 1 mA / kW,
- fax, printer: 1 mA,
- PC, workstation: 2 mA,
- photocopier: 1.5 mA.

If long cables are installed downstream of the earth leakage protection devices, it may be necessary to take the natural capacitance formed by the cable/earth pair into account (order of magnitude: at 230 V, approximately 1.5 mA for 100 m).

Electrical and electromagnetic interference

Operation of earth leakage protection devices (cont.)

Switching capacitive or inductive components

- Switching on capacitors creates a transient inrush current similar to that shown in Fig. 1.
- Switching off inductive components, such as power supply transformers used for lighting (halogen or fluorescent) creates brief voltage surges, the frequency of which can reach 10 MHz.

Common mode voltage surges

Electrical networks can be exposed to transient voltage surges caused by:

- Lightning strikes: these voltage surges are represented normatively by a 1.2/50 μ s voltage waveform (see Fig. 2). The currents induced by these voltage surges are represented by a normalised 8/20 μ s waveform (see Fig. 3).
- Sudden changes in network operating conditions (faults, blown fuses, inductive load switching, MV switchgear operations, etc.).

When a fault occurs in an IT system (isolated neutral), a transient leakage current is created due to the sudden change in potential with respect to earth. A similar phenomenon can occur when a UPS switches between the mains supply and the battery supply, whilst the output neutral is briefly disconnected from the earth (then reconnected with a slight phase lag).

Fig. 1: 0.5 μ s/100 kHz normalised current waveform

Fig. 2: 8/20 μ s normalised current waveform

Fig. 3: 1.2/50 μ s normalised voltage waveform

Immunity of Schneider Electric earth leakage protection devices

The *SI* earth leakage protection devices, exclusive to Schneider Electric, demonstrated their immunity to nuisance tripping in all the cases of interference indicated below:

Interference	Non-tripping test conditions	Performance required by the IEC 61008 / 61009 standards	Performance of Schneider Electric's <i>SI</i> type earth leakage protection devices
Continuous interference			
Flow of harmonic currents to earth	1 kHz sine wave	-	8 x I Δ n
Transient interference			
Voltage surge induced by a lightning strike	1.2/50 μ s pulse (IEC/EN 61000-4-5)	4 kV between 5 kV conductors / earth	4.5 kV between 5.5 kV conductors / earth
Current induced by a lightning strike	8/20 μ s pulse (IEC/EN 61008)	250 A	5 kA
Operating transient current; indirect lightning strike current	0.5 μ s/100 kHz waveform (IEC/EN 61008)	200 A	400 A
Surge protective device operation downstream of the earth leakage protection device; switching on of capacitors	10 ms pulse	-	500 A
Electromagnetic compatibility			
Switching of inductive loads, fluorescent lighting, motors, etc.	Repeated bursts (IEC 61000-4-4)	4 kV / 2.5 kHz	5 kV / 2.5 kHz 4 kV / 400 kHz
Fluorescent lighting, circuits controlled by thyristors	150 kHz to 230 MHz conducted RF waves (IEC 61000-4-16)	3 V (IEC) 10 V (EN)	30 V
Radio waves (TV and radios, transmitters, telecommunication, etc.)	80 MHz to 1 GHz transmitted RF waves (IEC 61000-4-3)	3 V / m (IEC) 10 V / m (EN)	30 V / m

Electrical and electromagnetic interference

Operation of earth leakage protection devices (cont.)

Risk of non-tripping in a dangerous situation

When an insulation fault occurs in the DC stage of a switch-mode power supply (e.g. variable speed drive) or on a DC network supplied by a converter, the leakage current is rectified and is no longer a sine wave. This current waveform may not be transmitted correctly by the transformer located inside the earth leakage protection device. Consequently, a leakage current with a dangerous amplitude (greater than the nominal sensitivity of the earth leakage protection device) may not cause it to trip.

In order to select earth leakage protection devices that are appropriate to each situation, the IEC 60755 and IEC 61008 standards define three types of earth leakage protection devices, according to the waveforms that cause them to trip.

Type of earth leakage protection device	Checking fault-current tripping		Supply circuit protection
	Waveform	RMS value	
AC type	 <p>DB123640</p>	$I_{\Delta n}$	Current loads
A type	 <p>DB123641</p>	$1.4 I_{\Delta n}$	Single-phase loads with rectifiers (low-power variable speed drive, rectifier/charger, etc.)
B type	 <p>DB123642</p>	$2 I_{\Delta n}$	Three-phase loads with rectifiers (three-phase high-power high-duty variable speed drive, three-phase rectifier/charger, etc.)

Schneider Electric's **SI** earth leakage protection devices are also protected against the risk of non-tripping due to atmospheric conditions:

- Very cold temperatures (risk of mechanical parts freezing up): up to -25°C .
- Corrosive chemical agents (risk of corrosion of alloys used to manufacture sensitive mechanical components). For information on using earth leakage protection devices in corrosive atmospheres, see module CA908027.

Coordination

Switches and residual current circuit breakers protection

Like all the components of the electrical installation, switches must be protected:

- against overloads;
- against short circuits.

Coordination between the switches and its protection device must be guaranteed and proved by the manufacturer.

Moreover, in a TN earthing, it must be ensured that the protection devices are capable of interrupting earth fault currents of high amperage.

Overload protection

■ The current rating of the switches is the maximum current that it can withstand without being damaged.

■ It is protected against overloads by the circuit breaker located upstream on its power supply line⁽¹⁾.

As a consequence:

The rating of the switches must be equal to or greater than the rating of the circuit breaker located upstream.

Be careful: only the circuit breaker ensure the protection against overloads.

For example: on a circuit protected by an 32 A iC60 circuit breaker, an iSW-NA switches of rating 40 A or 63 A must be installed.

(1) In some countries, the installation standards consider that overload protection can be provided by all the downstream circuit breakers, if the sum of their ratings is less than or equal to the rating of the residual current circuit breaker.

Short-circuit protection

■ The switches is protected against short circuits by the circuit breaker (or fuse) located upstream on its power supply line⁽²⁾.

■ To prevent any damage, the circuit breaker must sufficiently limit any short-circuit current that could pass through the switches (up to the max. short-circuit current I_{sc} at its installation point).

The short-circuit withstand of the switches and residual current circuit breaker is given in the following tables, as a function of the upstream circuit breaker. It must be greater than or equal to the prospective short-circuit current I_{sc} at its installation point.

(2) Exemption in case of special installation described at the end of this document, page 782.

Example

Choice of protection devices Q1 and Q2 in the diagram opposite:

Circuit breaker Q1		
Rated current	Less than or equal to the cable withstand I _z	50 A
Breaking capacity	Greater than or equal to the short-circuit current I _{sc} (17 kA)	iC60N 2P or C120N 2P (20 kA under 230 V)
Residual current circuit breaker Q2		
Rated current	Greater than or equal to that of circuit breaker Q1	63 A
Short-circuit withstand (I _{nc})	Greater than or equal to the short-circuit current I _{sc} (12 kA)	Based on the tables opposite: ■ with iC60N: 20 kA: is suitable ■ with C120N: 20 kA: is suitable

Coordination

Residual current circuit breakers protection

Protection against earth fault currents

In the event of an insulation fault in a TN system, the phase-to-earth fault current is equal to the phase-to-neutral fault current.

- The residual current circuit breaker interrupts this current, if it does not exceed its specific breaking capacity $I_{\Delta m}$.
- If the fault current exceeds this value, it must be interrupted by the circuit breaker located upstream.

Therefore, the magnetic threshold (instantaneous tripping threshold) of the circuit breaker must always be less than or equal to the breaking capacity of the residual current circuit breaker ($I_{\Delta m}$).

Breaking and making capacity ($I_{\Delta m}$) of iID residual current circuit breakers

Rating (A)	iID type AC, A, SI	RCCB-ID type B
16	1500	-
25	1500	500
40	1500	500
63	1500	630
80	1500	800
100	1500	-
125	1250	1250

The combination of an iID residual current circuit breaker and an iC60 circuit breaker of appropriate rating naturally satisfies this condition.

Example:

- iID RCCB, rating 63 A: $I_{\Delta m} = 1500$ A;
- iC60N circuit breakers of rating 63 A:
 - B curve: magnetic threshold 189 to 315 A;
 - C curve: magnetic threshold 315 to 630 A;
 - D curve: magnetic threshold 630 to 882 A.

The condition is satisfied whatever the iC60 circuit breaker (of rating at most equal to 63 A).

For protection by fuse, the user should check that the fuse blowing time is less than the residual current circuit breaker's response time for a fault current of amplitude superior than $I_{\Delta m}$, i.e.: type Δ : 40 ms.

Using the coordination tables

This table takes in account:

- all types of faults: between phases, phase and neutral and between phase and earth.

- all earthing systems except IT.

See comment here below.

Depending on the network and the type of protection, the selection table below indicates which table should be consulted to find out the coordination value.

Coordination of Surge protection devices

> Design guide

Surge arresters for commercial
and industrial buildings

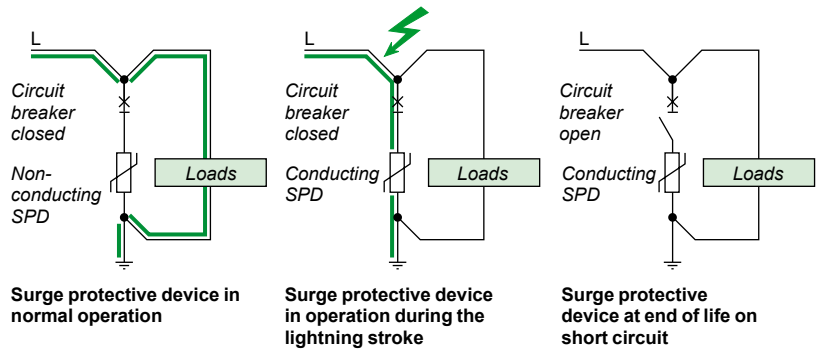

➤ Coordination between the surge protective device and its disconnect circuit breaker

MCCB = Molded-case circuit breaker.
MCB = Modular circuit breaker.
SPD = Surge protective device.

An external disconnecting device must be coordinated with a surge protective device in order to achieve:

- continuity of service:
 - do not trip due to surge current,
 - do not increase (Up) voltage protection level.
- effective protection against all types of overcurrents:
 - overload due to SPD aging,
 - short circuit of low intensity (impedant) due to temporary overvoltages,
 - short circuit of high intensity due to SPD degradation.

The disconnecting device must be coordinated with the surge protective device. It is designed to meet the following two constraints:

Resistance to lightning current

The resistance to lightning current is an essential characteristic of the surge protective device's external disconnecting device. The device must be capable of passing the following standardized tests: not trip upon 15 successive impulse currents at I_n .

Resistance to short-circuit current

The breaking capacity is determined by the installation rules (IEC 60364 standard):

- the external disconnecting device must have a breaking capacity equal to or greater than the presumed short-circuit current I_{sc} at the point of installation.
- when this device is integrated into the surge protective device, conformity with product standard IEC 61643-11 naturally ensures protection.

Surge protective device coordination (cont.)

			
External disconnecting device	Fuse protection combined with the SPD	Circuit breaker protection combined with the SPD	Circuit breaker protection integrated into the SPD
			
Lightning protection of equipment	=	=	=
Protection of installation (at end of the surge protective device's life)	=	+	++
	All types of disconnecting devices protect the equipment satisfactorily	Achieved if compliance with the MCB/SPD coordination table	Achieved during product design
Continuity of service (at end of the surge protective device's life)	+	+	+
	Protection from (impedant) short circuits of low intensity not well ensured	Only the surge protective device circuit is shut down	Protection against (impedant) short circuits of low intensity
Maintenance (at end of the surge protective device's life)	=	+	+
	Change of fuses	Immediate resetting	

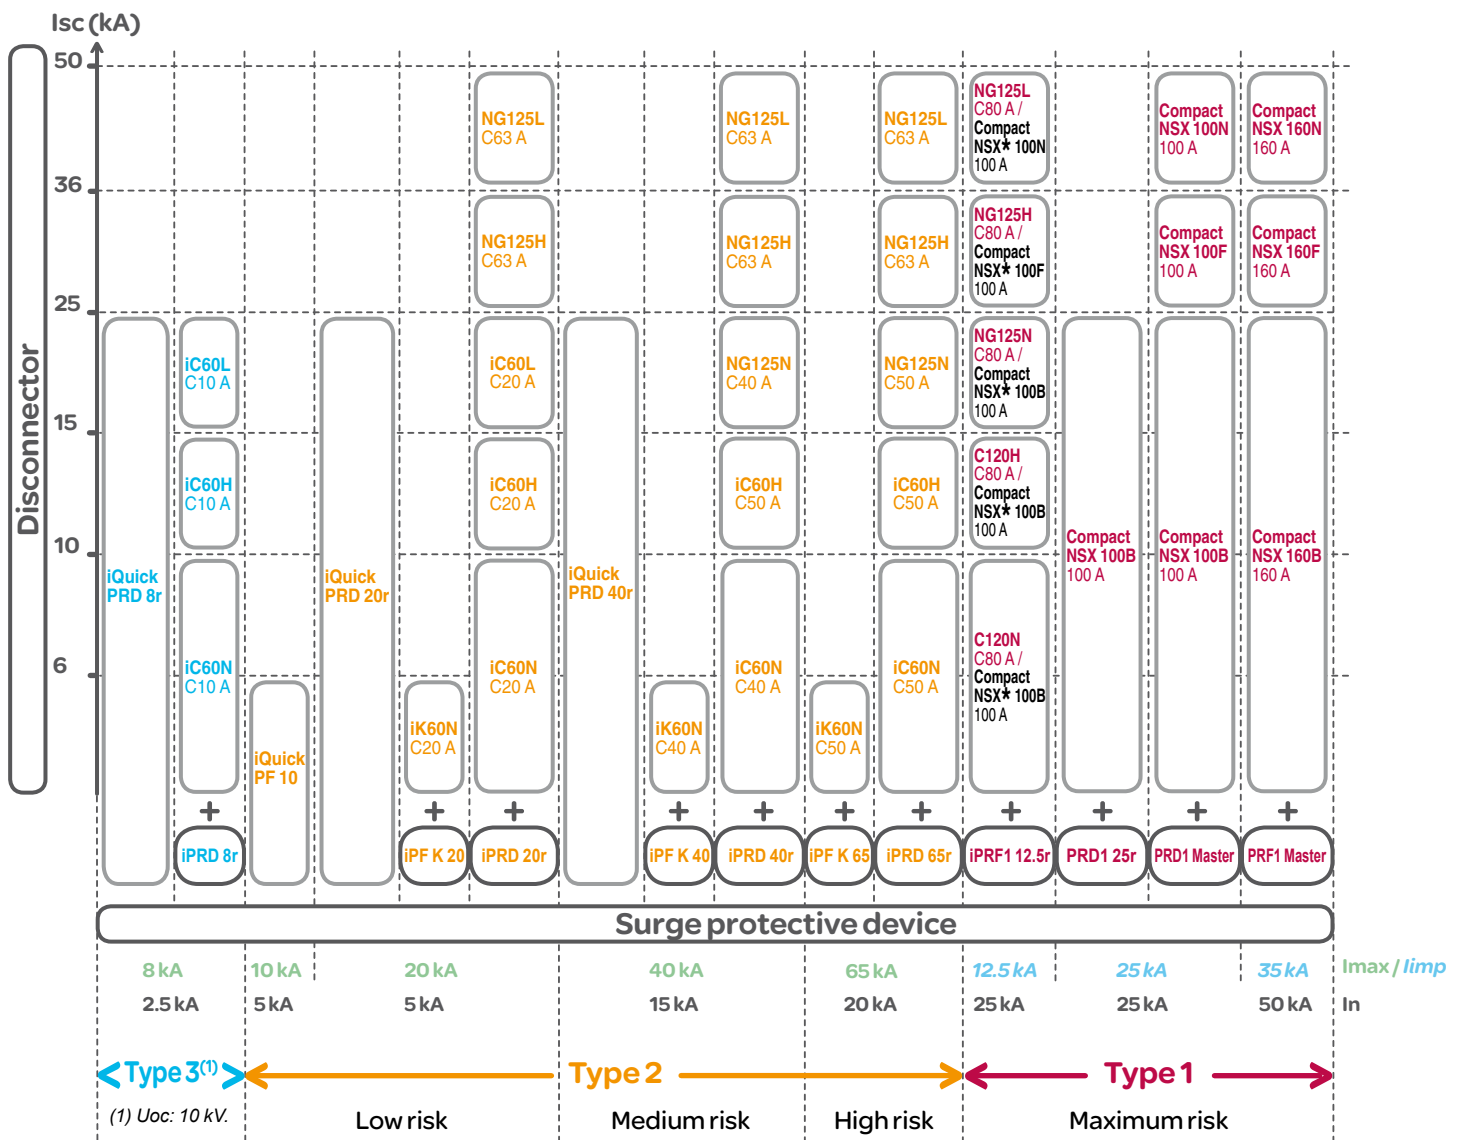

Main reasons why the disconnecting device recommended by the manufacturer should be used:

- if the disconnecting device's rating is lower than the recommended rating: risk of the disconnecting device opening in normal operation.
- if the disconnecting device's rating is higher than the recommended rating: risk of non-disconnection during a temporary voltage surge.

Surge protective device coordination (cont.)

➤ Coordination between the surge protective device and its disconnect circuit breaker in the event of a short circuit

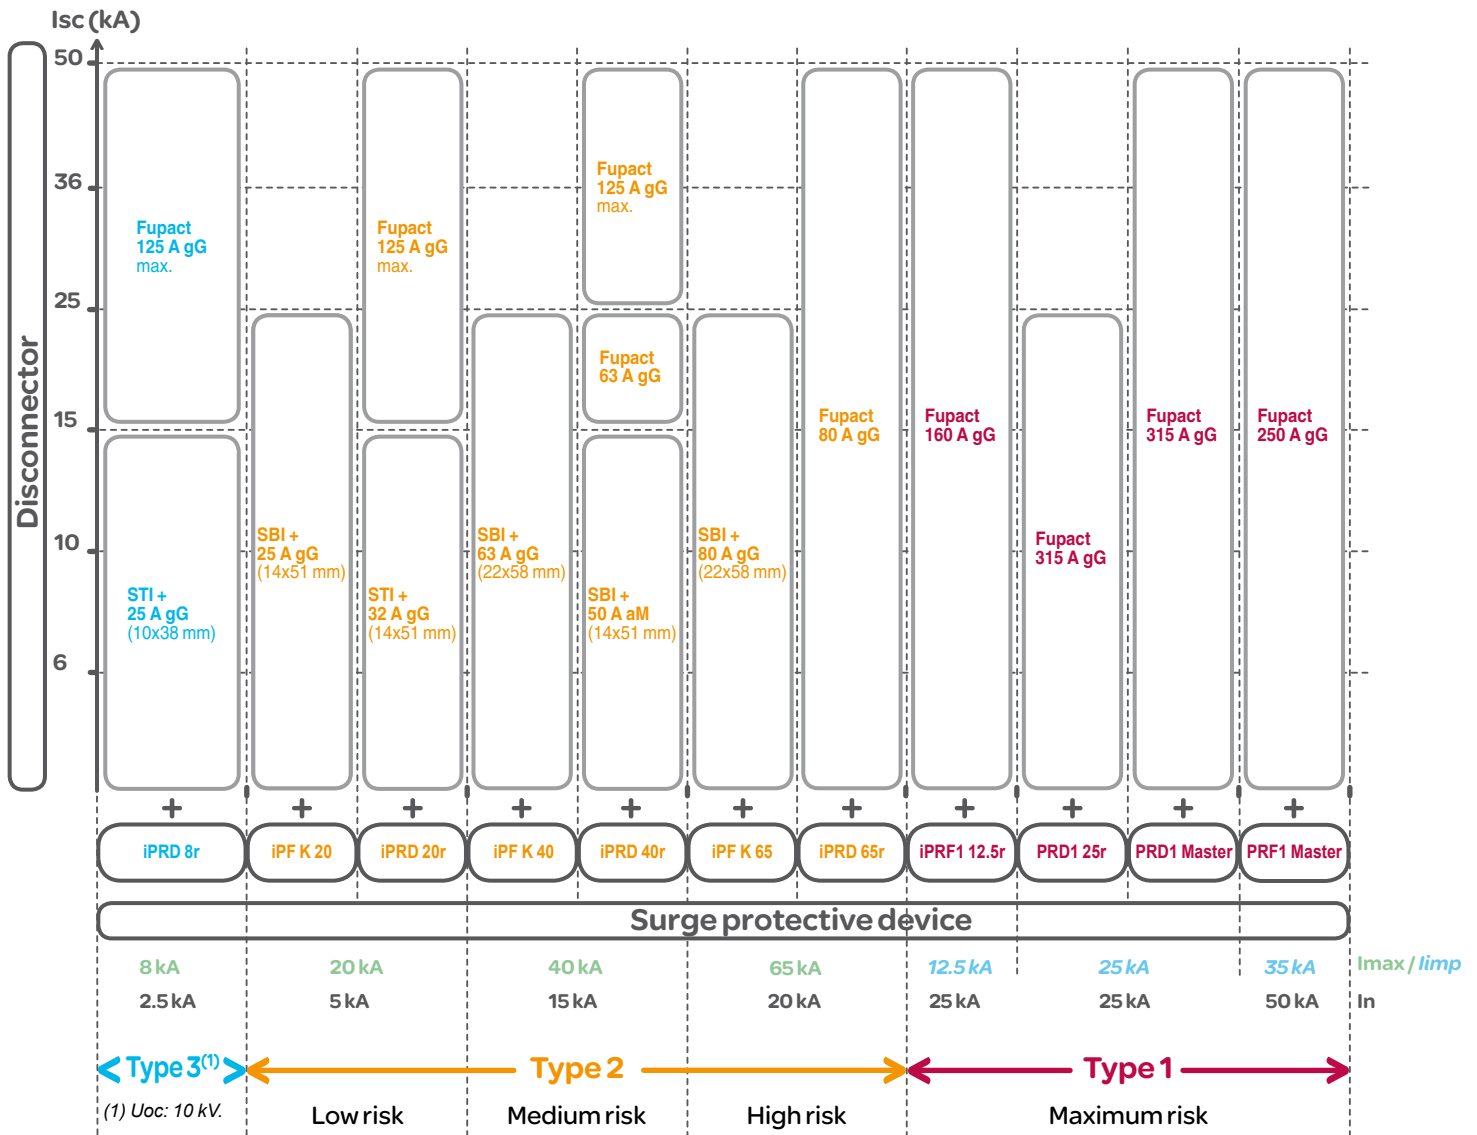

This table shows: the rating, curve and short circuit current level of the disconnector coordinated with the surge protective device.

(*) For lightning impulse current withstand

Surge protective device coordination (cont.)

➤ Coordination between the surge protective device and its disconnect fuse in the event of a short circuit

> Coordination between two surge protective devices, upstream/downstream

When two surge protective devices are installed in an electrical installation, coordination is needed according to IEC 61643-12 to obtain an acceptable stress distribution between the two surge protective devices according to their permissible energy "E".

L and Z_d represent the cable length and impedance respectively between the 2 surge protective devices.

Up2: level of protection of surge protective device SPD2.

Uw: impulse withstand voltage of the equipment to be protected.

I_{max}: maximum discharge current.

I_ε: lightning current:

$\leq I_{max}$ of SPD1

$= I_1 + I_2$

E: permissible energy.

MCB: modular circuit breaker.

SPD: surge protective device.

For coordination between two surge protective devices, a minimum cable length between these 2 surge protective devices is needed to ensure that:

- **$I_2 < I_{max}$ SPD2.**
- **$Up2 < Uw$.**
- **$E2 < E_{max}$ SPD2.**

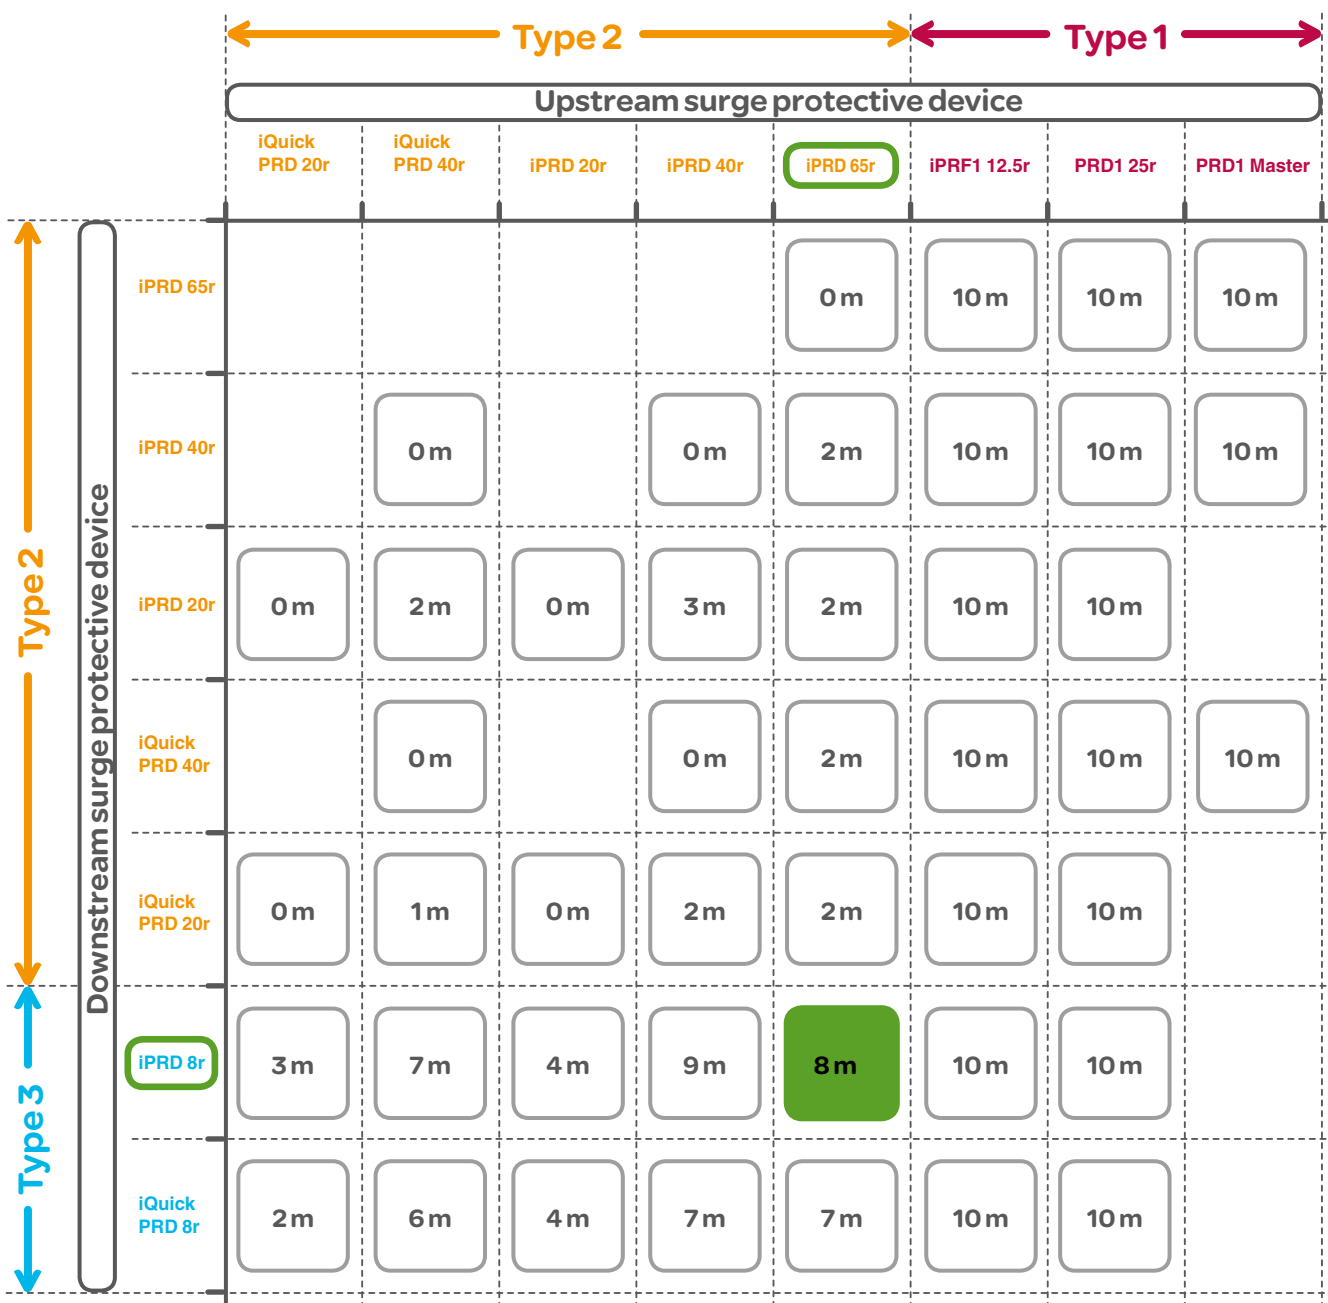

Surge protective device coordination (cont.)

Minimum distance between two surge protective devices, upstream/downstream

For a cable section of 16 mm² and an impulse current equal to the maximum discharge current (I_{max}) of the upstream surge protective device.

Example

If iPRD65r is installed in the incoming panelboard, the second SPD iPRD8r must be installed at a cable length of 8 meters from the first one.

> Cascading in the event of a short circuit between the surge protective device disconnecter and the upstream circuit breaker

What is cascading?

Cascading means using the circuit breakers' limiting power, which allows circuit breakers of lower performance to be installed downstream.

The upstream circuit breakers then act as a barrier for major short-circuit currents. They thus enable circuit breakers of breaking capacity lower than the presumed short-circuit current (at their point of installation) to be loaded in their normal breaking conditions.

Since current limiting takes place all along the circuit controlled by the upstream current-limiting circuit breaker, cascading concerns all the devices located downstream of that circuit breaker.

It is not restricted to two consecutive devices.

Case 1

Disconnect circuit breaker not integrated into the surge protective device.

For this type of study, refer to the existing coordination tables.
> see 557F4200 catalogue module.

MCCB = Molded-case circuit breaker.
MCB = Modular circuit breaker.
SPD = Surge protective device.

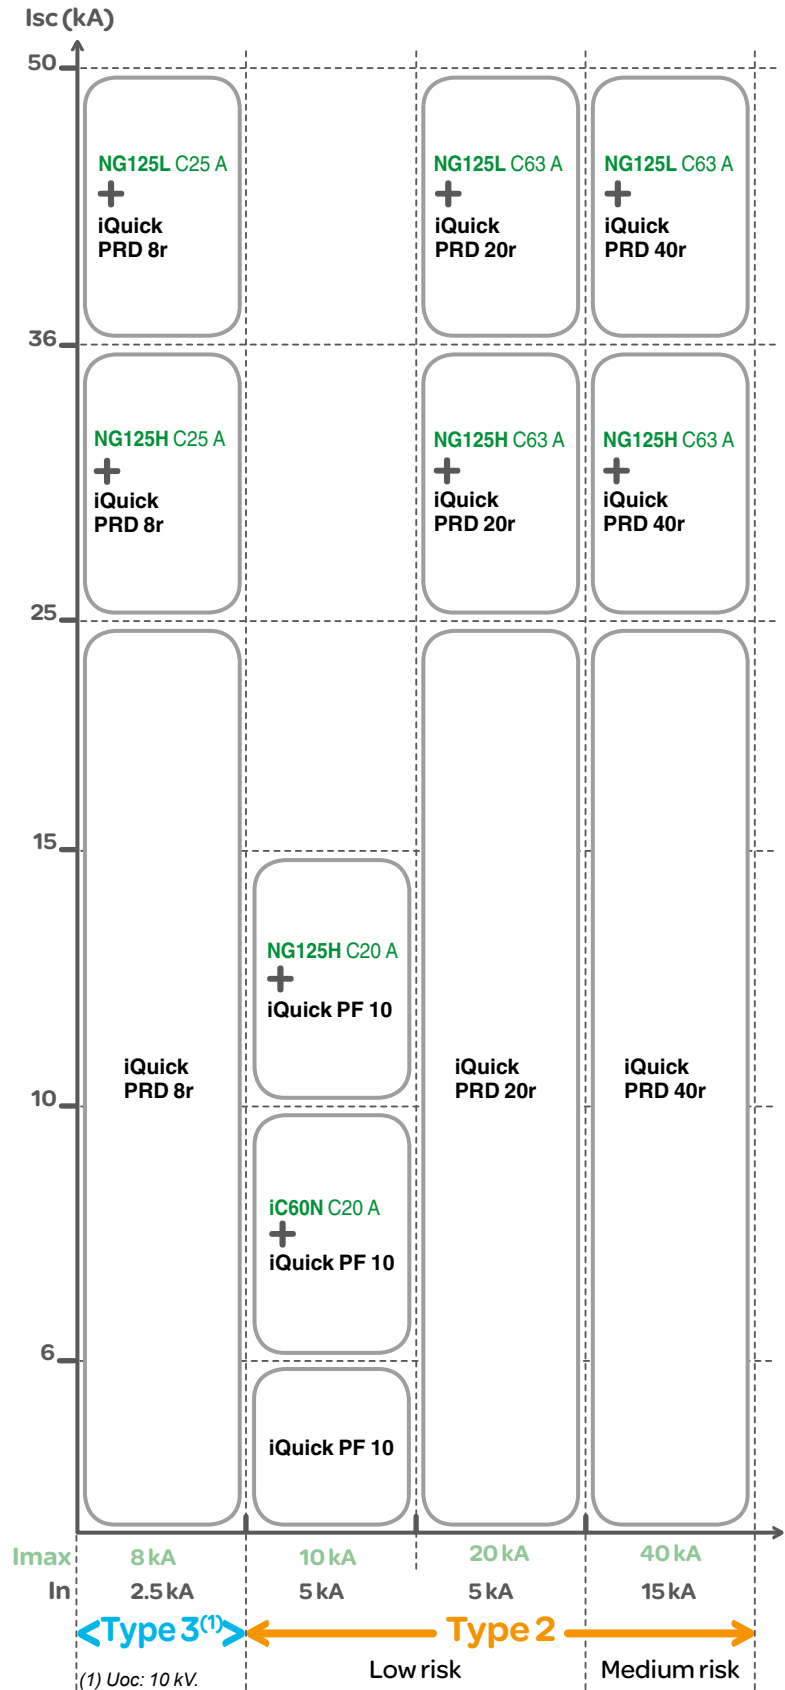

Surge protective device coordination (cont.)

Case 2

Disconnect circuit breaker integrated into the surge protective device.

MCCB = Molded-case circuit breaker.
MCB = Modular circuit breaker.
SPD = Surge protective device.

Coordination of switchgear with loads

Circuit breakers

Use of circuit breakers

The new lighting technologies with electronic interfaces (ballasts, drivers) cause a high transient inrush current at power up that can trip the circuit breaker. These phenomena are particularly increased with LED lighting.

Coordination curves between the number of LED luminaires and the circuit breaker rating:

Maximum number of luminaires depending on the circuit breaker rating and curve

Unit power of the luminaire (W)	Circuit breaker rating	10 A				16 A				20 A			
		Curve B	C	D	B, C, D with iCT+ or iTL+	B	C	D	B, C, D with iCT+ or iTL+	B	C	D	B, C, D with iCT+
10		15	30	48	-	22	44	69	-	32	63	98	-
30		11	24	38	57	17	34	54	90	25	49	77	110
50		8	17	27	41	12	25	39	66	18	35	56	83
75		4	11	17	28	7	15	25	44	11	21	36	55
150		-	5	9	13	2	7	12	22	4	9	18	28

According to the control device used, the transient current surge may:

- require the circuit breaker to be derated according to the number of luminaires / circuit breaker rating coordination curves, when using standard control devices: CT, TL (electromechanical control device),
- be reduced by the use of the following technologies:
 - softStart: using a command integrated in the driver or a dimmer switch,
 - controlled contactor (iTL+, iCT+) (closes when the voltage passes through "0", derating is related to the Cos phi of the lighting circuit).

These technologies allow circuit breakers without derating related to the technology of the lamps to be used.

Example:

Circuit rated power = 230 V AC x Circuit breaker rating x Cos phi.

Coordination of switchgear with loads

iCT, iCT+, iTL, iTL+, Reflex iC60

General comment

Modular contactors and impulse relays do not use the same technologies. Their rating is determined according to different standards and does not correspond to the rated current of the circuit. For example, for a given rating, an impulse relay is more efficient than a modular contactor for the control of light fittings with a strong inrush current, or with a low power factor (non-compensated inductive circuit).

Relay rating

- The table below shows the maximum number of light fittings for each relay, according to the type, power and configuration of a given lamp. As an indication, the total acceptable power is also mentioned.
- These values are given for a 230 V circuit with 2 active conductors (single-phase phase/neutral or two-phase phase/phase). For 110 V circuits, divide the values in the table by 2.
- To obtain the equivalent values for the entire 230 V three-phase circuit, multiply the number of lamps and the maximum power output:
 - by $\sqrt{3}$ (1.73) for circuits with 230 V between phases without neutral;
 - by $\sqrt{3}$ for circuits with 230 V between phase and neutral or 400 V between phases.

Note: The power ratings of the lamps most commonly used are shown in bold. For powers not mentioned, use a proportional rule with the nearest values.

(1) Circuits with non-compensated ferromagnetic ballasts consume twice as much current for a given lamp power output. This explains the small number of lamps in this configuration.

(2) The total capacitance of the power factor correction capacitors in parallel in a circuit limits the number of lamps that can be controlled by a contactor. The total downstream capacitance of a modular contactor of rating 16, 25, 40 or 63 A should not exceed 75, 100, 200 or 300 µF respectively. Allow for these limits to calculate the maximum acceptable number of lamps if the capacitance values are different from those in the table.

Note: Reflex iC60

High-pressure sodium vapour lamp with electronic ballast

For the 10 A and 16 A B-curve ratings, the number of lamps should be reduced by 10 % to limit unwanted magnetic tripping.

LED lamp

B-curve ratings, the number of lamps should be reduced by 50 %.

D-curve ratings, the number of lamps should be increased by 50 %.

Coordination of switchgear with loads

iTL, iCT

Heating application

■ Impulse relay rating to be chosen according to the power to be controlled.

230 V heating

Type	Maximum power for a given rating	
	iTL impulse relays	
Single-phase circuit	16 A	32 A
Heating (AC1)	3.6 kW	7.2 kW

■ Contactor rating to be chosen according to the power to be controlled and the number of operations a day.

230 V heating

Type of heating application	Maximum power for a given rating			
	iCT contactors			
Number of operations / day	25 A	40 A	63 A	100 A
25	5.4 kW	8.6 kW	14 kW	21.6 kW
50	5.4 kW	8.6 kW	14 kW	21.6 kW
75	4.6 kW	7.4 kW	12 kW	18 kW
100	4 kW	6 kW	9.5 kW	14 kW
250	2.5 kW	3.8 kW	6 kW	9 kW
500	1.7 kW	2.7 kW	4.5 kW	6.8 kW

400 V heating

25	16 kW	26 kW	41 kW	63 kW
50	16 kW	26 kW	41 kW	63 kW
75	14 kW	22 kW	35 kW	52 kW
100	11 kW	17 kW	26 kW	40 kW
250	5 kW	8 kW	13 kW	19 kW
500	3.5 kW	6 kW	9 kW	14 kW

Small motor application

Contactor rating to be chosen according to the power to be controlled.

Asynchronous single-phase motor with capacitor

Small motor application type	Maximum power for a given rating		
	iCT contactors		
Voltage	25 A	40 A	63 A
230 V	1.4	2.5	4

Asynchronous three-phase motor

400 V	4	7.5	15
-------	---	-----	----

Universal motor

230 V	0.9	1.4	2.2
-------	-----	-----	-----

Auxiliary indicating contacts for Acti 9 protective devices

Table showing state of auxiliary contacts according to the main device and the type of fault.

Functions and use	Main device		Auxiliary contacts	
	Circuit breaker	Residual current circuit breaker	OF	SD
Closed	<p>DB123286</p>	<p>DB123289</p>	<p>DB123292</p>	
Manually opened	<p>DB123277</p>	<p>DB123278</p>	<p>DB123290</p>	
Tripped by release auxiliary (iMN, iMX)	<p>DB404827</p>	<p>DB404829</p>	<p>DB123291</p>	
Tripped upon overload or short circuit	<p>DB123285</p>	-	<p>DB123291</p>	
Tripped upon earth fault	<p>DB404826</p>	<p>DB123287</p>	<p>DB123291</p>	

Auxiliary indicating contacts for Acti 9 protective devices (cont.)

Function

RESET (SD contact)

When the main device is tripped and the fault has been eliminated, it is possible to switch the SD contact manually, via the "RESET" button on the front panel. The unit is then in "device opened manually" configuration.

TEST (SD or OF contact)

When the main device is opened or tripped, the TEST button can be used to check the satisfactory operation of the indicating circuit by simulating operation of the main device. This operation also modifies the position of the indicator on the front panel of the iSD auxiliary.

On the double contact (iOF/SD+OF or iOF+SD24), this function can be implemented only for the SD indicating circuit.

iOF/SD+OF double contact

Change of function of the second contact from OF to SD.

Technical data

iOF+SD24 connection

The indicating auxiliary iOF+SD24 can be connected with a factory-built link, **A9XCAU06**: moulded connector (iOF+SD24 side) and with the 5 wires (PLC side).

A9XCAU06

Or using a Ti24 5-point connector, **A9XC2412**

A9XC2412

Auxiliary trip units for Acti 9 protective devices

iMN/iMNs powered by main network

iMN/iMNs with separate power supply

iMN, iMNs: undervoltage release units

Function

- Tripping of the associated protective device, when the voltage across its terminals falls:
 - either by opening the control circuit (e.g. push-button),
 - or by lowering the supply voltage.
- Resetting of the protective device is possible only after the voltage across the terminals of the auxiliary has returned to its nominal value.
- The iMNs undervoltage release does not perform tripping in the event of a voltage drop lasting less than 200 ms.
- A locking push-button control allows the circuit protected by the circuit breaker (e.g. machine control) to be placed in safety configuration.

Technical data

Auxiliary trip units		iMN			iMNs

Endurance		20,000 operations				
Insulation voltage (Ui)		400 V				
Degree of pollution		3				
Rated impulse withstand voltage (Uimp)		4 kV (6 kV relative to the associated protective device)				

(1) For a lower power supply (e.g., control by a PLC output), an iRTBT interface must be implemented (see page 813).
 (2) This characteristic must be taken into account to define the number of multiple controls by switches provided with an indicator lamp.

Operation timing chart

iMNx: trip units with push-button control

Function

- Tripping of the associated protective device by opening of the control circuit (e.g. push-button, dry contact).
- A drop in the supply voltage does not trip the associated protective device.
- A locking push-button control allows the circuit protected by the circuit breaker (e.g. machine control) to be placed in safety configuration.

Important: Before any servicing operation switch off the mains power supply (voltage presence at terminals E1/E2)

Operation timing chart

iMX powered by main network

Control by N/O push-button with verification of voltage presence (iMX+OF)

iMX, iMX+OF: shunt release units

Function

- Tripping of the associated protective device when a voltage appears across the terminals of the auxiliary (control by: N/O push-button, dry contact, etc.).
- Resetting of the protective device is possible only when the voltage across the terminals of the auxiliary has disappeared.
- A locking push-button control allows the circuit protected by the circuit breaker (e.g. machine control) to be placed in safety configuration.

Three-phase power supply monitoring

Single-phase power supply monitoring

iMSU: overvoltage release units

Function

- Tripping of the associated protective device when the voltage across its terminals exceeds its nominal value.
- This auxiliary can protect sensitive loads from mains voltage fluctuations, in particular those due to breakage of the neutral conductor.
- Resetting of the protective device is possible only when the voltage across the terminals of the auxiliary has returned to its nominal value.
- When assembling with the associated device:
 - take the operating temperature range of the associated protective device into account
 - when the assembly is complete, test the handle of the associated protective device.

Electrical auxiliaries for iC60, iID, iSW-NA, ARA and RCA

The mounting order for the various auxiliaries must be complied with.
The tripping auxiliaries (iMN, iMX) should be mounted first, as close as possible to the circuit breaker or the residual current circuit breaker. Then, the indicating auxiliaries (iOF, iSD) should be mounted, complying with their position shown in the following table.

Indicating auxiliaries

PE104474-25

PE104475-25
