Safety Information

Important Information
Read these instructions carefully and look at the equipment to become familiar with the device before trying to install, operate, service, or maintain it. The following special messages may appear throughout this documentation or on the equipment to warn of potential hazards or to call attention to information that clarifies or simplifies a procedure.

The addition of this symbol to a Danger or Warning safety message indicates that an electrical hazard exists, which will result in personal injury if the instructions are not followed.

This is the safety alert symbol. It is used to alert you to potential personal injury hazards. Obey all safety messages that follow this symbol to avoid possible injury or death.

**DANGER**
DANGER indicates a hazardous situation which, if not avoided, will result in death or serious injury.

**WARNING**
WARNING indicates a hazardous situation which, if not avoided, can result in death or serious injury.

**CAUTION**
CAUTION indicates a potentially hazardous situation which, if not avoided, can result in minor or moderate injury.

**NOTICE**
NOTICE is used to address practices not related to physical injury.
Please Note

Electrical equipment should be installed, operated, serviced, and maintained only by qualified personnel. No responsibility is assumed by Schneider Electric for any consequences arising out of the use of this material.

A qualified person is one who has skills and knowledge related to the construction and operation of electrical equipment and the installation, and has received safety training to recognize and avoid the hazards involved.

Before You Begin

Do not use this product on machinery lacking effective point-of-operation guarding. Lack of effective point-of-operation guarding on a machine can result in serious injury to the operator of that machine.

⚠️ WARNING

EQUIPMENT OPERATION HAZARD
- Verify that all installation and set up procedures have been completed.
- Before operational tests are performed, remove all blocks or other temporary holding means used for shipment from all component devices.
- Remove tools, meters, and debris from equipment.

Failure to follow these instructions can result in death or serious injury.

Follow all start-up tests recommended in the equipment documentation. Store all equipment documentation for future reference.

Test all software in both simulated and real environments.

Verify that the completed system is free from all short circuits and grounds, except those grounds installed according to local regulations (according to the National Electrical Code in the U.S.A, for instance). If high-potential voltage testing is necessary, follow recommendations in equipment documentation to prevent accidental equipment damage.

Operation and Adjustments

The following precautions are from the NEMA Standards Publication ICS 7.1-1995 (English version prevails):
- Regardless of the care exercised in the design and manufacture of equipment or in the selection and ratings of components, there are hazards that can be encountered if such equipment is improperly operated.
- It is sometimes possible to misadjust the equipment and thus produce unsatisfactory or unsafe operation. Always use the manufacturer’s instructions as a guide for functional adjustments. Personnel who have access to these adjustments should be familiar with the equipment.
manufacturer’s instructions and the machinery used with the electrical equipment.

- Only those operational adjustments actually required by the operator should be accessible to the operator. Access to other controls should be restricted to prevent unauthorized changes in operating characteristics.

Acceptable Use

SCADAPack controllers and expansion modules are intended for use in monitoring and controlling non-critical equipment only. They are not intended for safety-critical applications.

⚠️ WARNING

UNACCEPTABLE USE

Do not use SCADAPack controllers and expansion modules as an integral part of a safety system. These devices are not safety products.

Failure to follow these instructions can result in death or serious injury.

⚠️ CAUTION

EQUIPMENT OPERATION HAZARD

When devices are used for applications with technical safety requirements, the relevant instructions must be followed.

Use only Schneider Electric software or approved software with Schneider Electric hardware products.

Failure to follow these instructions can result in minor or moderate injury.
About The Book

At a Glance

Document Scope
This manual describes the operation and maintenance of the 5502 Differential Analog Input module.

Validity Notes
This document is valid for all versions of the 5502 Differential Analog Input module.

Product Related Information

⚠️ WARNING

UNINTENDED EQUIPMENT OPERATION

The application of this product requires expertise in the design and programming of control systems. Only persons with such expertise should be allowed to program, install, alter and apply this product.

Follow all local and national safety codes and standards.

Failure to follow these instructions can result in death or serious injury.

User Comments
We welcome your comments about this document. You can reach us by e-mail at supportTRSS@schneider-electric.com.
Overview

The Model 5502 Differential Analog input module adds eight Differential analog inputs to the 5000 input/output system. Up to sixteen model 5502 modules may be connected to the I/O bus, for a total of 128 analog inputs per bus. The 5502 module can be used to measure ±10V analog signals and 0-20mA analog signals.

The 5502 module uses a 13 bit plus sign analog to digital converter (ADC). A single chip microcontroller with integral watchdog timer operates the module and communicates over the I/O bus.

Inputs are fuse and transient protected and optically isolated from the main logic power and the other analog inputs.

Figure 1: 5502 Differential Analog Input Module
Installation

The installation of the 5502 module requires mounting the module on the 7.5mm by 35mm DIN rail and connecting the module to the system I/O Bus. Refer to the System Configuration Guide for complete information on system layout, I/O Bus cable routing and module installation.

Field Wiring

The 5502 module provides eight Differential analog inputs. Figure 2: Typical 5502 Field Wiring shows how to wire the inputs.

Screw termination style connectors are used for termination of field wiring. They accommodate solid or stranded wires from 22 to 12 AWG.

The connectors are removable. This allows module replacement without disturbing the field wiring. Leave enough slack in the wiring for the connector to be removed.

Remove power before servicing unit.

To remove the connector:

- Pull the connector upward from the board. Apply even pressure to both ends of the connector.

To install the connector:

- Line up the pins on the module with the holes in the connector.
- Push the connector onto the pins. Apply even pressure to both ends on the connector.

Figure 2: Typical 5502 Field Wiring
Address Selection

The 5000 I/O bus will support a maximum of twenty I/O (input/output) modules. 5000 I/O module types may be combined in any manner to the maximum supported by the controller used. The types of input and output modules available are:

- Digital Input modules
- Digital Output modules
- Analog Input modules
- Analog Output modules
- Counter Input modules

Each type of I/O module, connected to the I/O bus, has a unique I/O module address. Different types of I/O modules may have the same module address.

The address range supported by the SCADAPack controller module may restrict the I/O module address range. Refer to the controller manual for the maximum address supported.

The three address switches in the dip switch package SW1 labeled 1, 2, 4 and 8 set the module address. To set the address:

- Open the four switches by sliding the actuators to the left side of the switch.
- Close the switches by sliding the actuators to the right such that they total the desired address.

*Figure 3: 5502 Differential Analog Input Module Address Switches* shows the switch setting for the 16 possible module addresses.
How to Set Switches
- Determine the module address.
- Slide the actuator of the switch to the side shown in gray above.

Slide to this side to add switch value
Slide to this side to ignore switch value

Figure 3: 5502 Differential Analog Input Module Address Switches

Voltage or Current Range Selection

The 5502 module measures voltages in the range of $-10V$ to $+10V$ with respect to the $-ve$ input of the measuring channel. Currents in the range of $-20mA$ to $+20mA$ can be measured by on any of the inputs by inserting an onboard $250\Omega$ resistor in current loop. The resulting voltage input will be $-5V$ to $+5V$. This resistor is added by closing the appropriate switch labeled 0 through 7 in the dip switch package SW2. Close the switch by sliding the actuator up to the ON position.

AC Rejection Selection

The 5502 module samples the analog inputs several times for optimum rejection of AC noise. 60 Hz. AC rejection is obtained when the actuator for the switch labeled 50/60 is in the left position. 50 Hz. AC rejection is obtained when the actuator for the switch labeled 50/60 is in the right position.
Operation and Maintenance

Data Format

5000 analog input and output modules use 16 bit signed numbers (15 bits plus sign). The readings are to provide output data in the 16 bit signed format.

The table below shows output values for several voltages and currents.

Maintenance

This module requires no routine maintenance. If the module is not functioning correctly, contact Schneider Electric Technical Support for more information and instructions for returning the module for repair.

Troubleshooting

<table>
<thead>
<tr>
<th>Condition</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Inputs read near 0.</td>
<td>Check and if necessary replace the input fuse.</td>
</tr>
<tr>
<td>Input voltages read slightly low.</td>
<td>Check SW2 and check the switch is in the voltage position.</td>
</tr>
<tr>
<td>Reading is constant.</td>
<td>Check that the analog input is not forced.</td>
</tr>
</tbody>
</table>

Fuses

Each input is has an 1/8A fuse. This fuse will blow when the input voltage exceeds approximately 12V. The fuse is Littelfuse NANO-SMF 1/8A Fast-Acting fuse. Replacement fuses are available from Schneider Electric.

Schneider Electric part number: TBUM297259

Littelfuse part number: R451.125
Calibration

The 5502 module is calibrated and burned in at the factory. It does not require periodic calibration. Calibration may be necessary if the module has been repaired as a result of damage.

There is one potentiometer for calibration of the analog inputs. The GAIN potentiometer (R14) adjusts the gain.

Calibration requires that you read the converted value from the module using a communication controller, SCADAPack or TeleSAFE Micro16 controller module. Refer to the controller module manual for details.

To calibrate the module:

- Select an input and check the associated switch in the dipswitch package SW2 is OFF.
- Short the selected analog input.
- Adjust the ZERO potentiometer (R20) until a reading of 0 is obtained.
- Apply a voltage between 9 and 10 Volts on the selected analog input.
- Calculate the correct reading for the applied voltage using the formula:
  \[
  \text{reading} = \frac{32768 \times \text{voltage}}{10}
  \]
- Adjust the GAIN potentiometer (R19) until the correct reading is obtained.

The calibration may be verified by applying other voltages or voltages of the opposite polarity to the other input terminals. Use the formula above to determine the correct reading for each input voltage.
# Specifications

**Disclaimer:** Schneider Electric reserves the right to change product specifications. For more information, visit [http://www.schneider-electric.com](http://www.schneider-electric.com).
