

# Move towards Schneider Electric presence and motion sensors

Be it outdoors or indoors, surface- or flush-mounted – Schneider Electric has the appropriate solution for each building and room type: Whether privat house, office or hotel corridor, whether with conventional installation or integrated into a KNX system, help your customers achieve significant energy savings – with presence and motion sensors!

#### Outdoor sensors

ARGUS 220 motion sensor

ARGUS Standard 120 motion sensor

ARGUS 360 motion sensor

#### Indoor sensors

ARGUS presence sensor

ARGUS Standard 360, false ceiling presence sensor

KNX Mini presence sensor

ARGUS 180 UP with switch presence sensor

# In all building types ...

The selection of the appropriate movement and presence sensors depends on the movement behaviour and the usage of space by your customers. The right product installed in the right place is critical for the efficient control of lighting, temperature and ventilation.

#### In homes...

outdoor motion sensors significantly enhance security and the comfort of residents on paths, in house facades or driveways. Nobody should have to grope around in the dark any more with motion sensors in corridors, staircases, basement exits or rarely used rooms. The fact that energy is only consumed when it is needed saves money and also protects the environment.

#### In offices...

motion sensors prevent unnecessary energy consumption as lights are switched on as needed: in long corridors and in rarely used rooms. Presence sensors are effective in offices and meeting rooms, especially if the heating and ventilation are combined with the lighting.

#### In public buildings...

such as schools, hospitals or gyms, movement and brightness-dependent control of lighting, temperature and ventilation is most effective – because as there are other more important things going on, turning off the light is often forgotten.

# ... the right technology

The required function scope determines the technological basis of movement and presence sensors. This means that efficient convenience and safety solutions can be implemented, from an individual room solution to complete building control.

#### Fast, simple and effective: conventional

Conventional movement- and brightness-dependent lighting control is a good idea wherever light switches can simply be replaced by flushmounted motion sensors.

#### Systematic convenience and flexibility: networking

Networking individual movement and presence sensors into a system not only increases safety and convenience, but above all the flexibility of control of associated utilities.

#### Intelligent and comprehensive: KNX

KNX-based lighting control by movement and presence sensors is suitable wherever these are integrated into larger, automated control processes.

# Private house

In homes, family life is important and people do not want to have to worry about security. Motion sensors can contribute significantly to this. Properly located and installed, they are valuable everyday assistants and also the most cost-effective solution to save energy.

### Outside

#### Good visibility at any time of day

The route from a parking space to a building entrance can easily become a tripping hazard in twilight or darkness. The search for the keyhole is complicated due to insufficient illumination.

Motion sensors with different areas of detection ensure a customised adjustment to each situation: The combination of motion

sensors for long house facades and for house corners provides seamless lighting of outdoor areas.

Safety can also be increased subsequently. Networking outdoor motion sensors by radio is the flexible solution for retrofitting without the need for cables.

## Utility room

#### A motion sensor is intuitive

A laundry room is used infrequently. Door open, store purchases, and leave the room again. Not only in rarley-used rooms, but also in passage areas such as corridors it can easily happen that the extinction of the light is forgotten. How convenient then that the motion sensor automatically controls the light.

The individually adjustable overshoot time of the motion sensor switches the lights off automatically – from 1 second to 8 minutes, whatever you need.

### Child's room

#### Automatic switch-off

In the children's room there's plenty of movement because today is all about the upcoming football match. Is everything packed, nothing forgotten? The excitement is so great that when they left the room, the light was left on. No problem! The motion sensor switches off the lights for you.

Additional flexibility is provided by the integrated switch, which allows the movement-dependent control to be deactivated easily. This is particularly important at night, so that turning over in bed does not inadvertently turn on the light. Also in bathrooms the motion sensor with integrated switch is particularly suitable.

# Products and functions in a private house

Solution: Outdoor and indoor motion sensors

Plan and implement cost and energyefficient solutions for flats and homes using the motion sensor range from Schneider Electric. Advantage: High convenience and security, lower energy costs

With motion sensors you increase the convenience and security of your customers. In single-family homes, savings of up to 30% are also achievable.

ARGUS 220

Outdoor motion sensor 220° detection angle, for monitoring building facades

ARGUS 110

110° detection angle, for monitoring smaller house facades

ARGUS Standard 120

ARGUS Standard 360

Outdoor motion sensor

Outdoor motion sensor 120° detection angle, for monitoring smaller house facades

Outdoor motion sensor 360° detection angle, for installation on house corners

ARGUS 180/2,20

Indoor motion sensor 180° detection angle, mounting height 2.20 m

ARGUS 180

Indoor motion sensor 180° detection angle

ARGUS 180

Indoor motion sensor 180° detection angle, with integrated switch

ARGUS Standard 360

Indoor motion sensor 360° detection angle, for ceiling mounting

### Solutions with KNX

In houses equipped with KNX too, KNX motion and presence sensors allow needs-based control of lighting and temperature.

**KNX ARGUS** 220

KNX outdoor motion sensor 220° detection angle

**KNX ARGUS** Presence 180

KNX indoor motion sensor 180° detection angle, mounting hight 1m

**KNX ARGUS** Presence 180/2,20

KNX indoor motion sensor 180° detection angle, mounting hight 2.20m

# Office

Owing to the numerous different areas used, offices provide plenty of options to achieve high levels of energy-saving potential as in commercially used buildings it is often the case that electrical devices are not switched off after use. The movement and brightness-dependent control of lighting, temperature and ventilation can be perfectly adapted to the user's behaviour at their workplaces.

### Corridor

#### Security in frequently used walkways

Corridors are often long and insufficiently lit links between working areas. People moving around in these areas are often so busy that control the light is the furthest thing from their minds. An efficient solution is therefore to employ several motion sensors. Parallel switching enables flush-mounted motion sensors in single detection areas to be

combined, ensuring secure lighting for the entire corridor regardless from which side it is entered. As soon as the motion sensor ceases to register any movement, the lights are switched off. This simple solution provides dual efficiency as it increases security whilst reducing electricity costs.

### Office room

#### Optimal conditions for high efficiency

Whether individual or open plan office, optimum lighting of the workplace increases comfort and efficiency. To control the lighting in a way which responds to both movement and brightness, a single ARGUS presence sensor, mounted above the desk, is sufficient for each room. In open plan offices, presence sensors switched in groups ensure complete lighting control above the workplace clusters.

What is particularly cost effective is that nonrequired lighting groups are automatically deactivated. You can manually switch the lighting on and off at any time using a remote control. That saves energy and reduces operating costs.

### Conference room

#### Two channels for double efficiency

Be it for staff meetings or presentations, automatic control ensures that the lighting and temperature in conference rooms is right so the occupants can focus on the more important issues at hand. The ARGUS Presence, which is installed above the conference table, ensures double efficiency. With its two channels, the lighting and temperature respectively ventilation can be set separately. The first channel switches the lights on if the room needs more illumination, but only until there is sufficient ambient brightness or there is no-one left in the room, at which point the lights are switched off.

The second channel is independent of brightness and switches on heating and ventilator motors.

### DALI and 1-10 V

1-10 V or the digital standard DALI are lighting control systems often used in office buildings. Integrating presence sensors makes it possible to have energy-efficient and needs-

based illumination of all kinds of workplaces. From individual to open-plan offices, lighting groups can be controlled according to presence.

# Products and functions in an office building

Solution: Movement and presence sensors

With the extensive movement and presence sensor product range from Schneider Electric, you can easily plan and implement convenient, safe and energy saving solutions, especially for office buildings.

Advantage: Comfort and safety for staff with lower operating costs

Increase comfort and security in office buildings with movement and presence sensors. In addition, savings of up to 40% are possible!

**KNX ARGUS 220**

Indoor motion sensor 180° detection angle, mounting height 2.20 m

**ARGUS 180** 

Indoor motion sensor 180° detection angle, with integrated switch

# Public building

Whether a sports club, school or hospital, public buildings have one thing in common: they are places where the movement and brightness-dependent control of lighting, temperature and ventilation can be especially useful for the efficient use of energy. Because other things are more important than switching lights in these buildings.

# Parking garage

#### Plenty of room for safety

Car parks and parking garages are usually permanently, but poorly lit. This is also the reason why they are perceived as being unsafe. A needs-based lighting control system not only enhances security but also prevents inefficient power consumption.

The positioning of ARGUS surface-mounted motion sensors on all entrances to the parking levels creates a solution that makes enery usage more efficient. Better illumination of the entrances and parking levels improves the sense of security - and the on-demand switching makes it efficient.

### Restroom

#### Control according to demand is desired

The lighting in rest rooms is rarely attuned to the usage patterns of its visitors. So it is possible that it is permanently on – but also that it is turned off even though another person is present.

The use of movement and presence sensors offers an effective and convenient solution, which also lowers costs.

### Course room

#### Perfect conditions for a workout

To meet the requirements of a course room in terms of light, temperature and ventilation needs, all you need is an ARGUS presence sensor. Placed centrally beneath the ceiling, it senses the presence of all people – regardless of whether they are training or taking a break.

The controlling via two channels enables the separate control of lighting and temperature. The on-demand control of room lighting and temperature creates an ideal training environment and only uses energy when needed.

# System linked

The presence sensors can be networked together using a special terminal with only a single additional core, to make a presence sensor system. In this way, for example, it is possible for long corridors with several access points to be illuminated automatically,

according to need. The intelligent master/ slave principle permits additional installation possibilities, as well as integration of extension units. This means lamps can be controlled both manually and automatically.

# Products and functions in public buildings

Solution: Movement and presence sensors

Implement an effective energy saving solution with the full movement and presence sensor range from Schneider Electric perfectly matched to the needs in public buildings.

Advantage: Lower energy costs, greater convenience and security

Movement and presence sensors can be perfectly matched to the behaviour of people in public buildings. In addition to great convenience and increased safety, potential savings of up to 40% are possible.

# Mode of operation

Movement and presence sensors use infra-red sensors to perceive temperature differences. The perception area is divided into zones and levels in which these temperature differences stand out as movement.

#### Motion sensor

Motion sensors respond to motion. If the light sensor measures low ambient light and the sensor detects a movement, it turns on the light for a pre-set duration. Motion sensors are particularly suitable for outdoor areas and indoor areas for rarely used rooms.

#### Presence sensor

Presence sensors react to the smallest movements, so they are ideal for indoor use in rooms with a high proportion of daylight or prolonged use. Once the ambient light falls below a certain level, the light is also switched on if a movement is detected.

Unlike the motion sensor, the presence sensor has two different channels: the first operates the lights and the second controls other functions such as heating,

air conditioning or ventilation. The first channel switches on according to daylight and movement, the second only for movement. So with sufficient light, no energy is wasted and all other functions work.

#### Angle of detection and range

The detection angle and the detection range determine the area in which movement can be detected. The higher these values are, the larger the area of detection is.

#### Mounting height

The mounting hight also influences the detection range. The higher the sensor is mounted, the greater the area covered. The sensitivity decreases, however, as the individual zones have increased.

### 7ones

3 security zones

Radially subdivided

Observed from above

#### Security zones

Most motion sensors have three security zones: the innermost zone covers the area directly below and behind the sensor, the other two cover the remainder of the detection area.

#### Sensor zones

All sensor zones are subdivided radially. Movements are detected by temperature differences in these subdivisions.

# Settings

Movement and presence sensors are equipped with a variety of settings. If all parameters are optimally adjusted to the individual application, it can achieve maximum energy efficiency.

### **Parameters**

#### Setting the overshoot time

 Defines the time until the light source is switched off again

#### Set twilight threshold

 Determines the brightness level at which the light is switched on

#### Setting the sensitivity

 Regulates the level of movement which is necessary to trigger the light

#### Additional adjustment settings for presence sensors:

#### Channel 1 settings

- For brightness-dependent control of lighting
- Brightness sensor seamlessly adjusable
- Overshoot time seamlessly adjusable

#### Channel 2 settings

- For brightness-independent activation of heating systems or fan motors
- Adjustable sensitivity (several movements within a certain time required before activation)
- Overshoot time seamlessly adjustable

# Individual settings

#### Overshoot time

Motion sensors not only make life safer and more comfortable, but also help save energy. You can individually set the overshoot time. After the set time, the light switches back off again automatically.

#### Remote controlled

Some motion sensor models can be remotely controlled: switching maintained light on and off, changing the twilight threshold and the switching time and the setting and modifying of movement sensitivity can be controlled with the remote control for increased convenience.

# Easy installation

Schneider Electric movement and presence sensors can not only be simply and quickly adapted to the needs of your customers. A number of installation advantages will also facilitate your work - from adjusting to the respective room situation through to fitting to ceilings and walls.

#### Large wiring compartments

Thanks to the large wiring compartment and four cable inlets with plug connections between the conductor and the wiring connection box, the cabling can be done by hand in time at all.

#### Wall spacers

Wall spacers facilitate perfect installation on uneven walls or if cables are fed from overhead.

#### Mounting bracket

Mounting brackets enable installation even on outside and inside corners as well as on cylindrical bodies such as drainpipes.

#### Movement direction

With the installation of movement and presence sensors, care is to be taken regarding the movement direction in the area to be covered. A movement past the sensor is recognised best.

# Presence sensors in a system

#### Parallel switching of sensors

The parallel switching of sensors extends the detection area. To avoid malfunctions, the light value and overshoot time parameters must be carefully adjusted on each sensor. It should be noted that parallel switching does not increase the total load. This is always the same regardless of the number of parallel sensors.

#### Master-slave switching

With the master-slave switch, a presence sensor's area of detection can be extended affordably. The master device switches connected devices to pre-set parameters the slave devices are used only for presence detection and send a pulse to the master device when movement is detected. This ensures consistent switching behaviour.

# The right positioning

The correct positioning of movement and presence sensors is important for their proper function: Glass walls, plants, but also heat sources can cause malfunctions.

# Thermal radiation does not penetrate through glass

When determining the position of movement and presence sensors, it is important to note that areas of detection are limited by glass surfaces.

#### Trouble-free operation

The twilight threshold, brightness sensor and overshoot time are seamlessly adjustable and can be easily adapted to existing requirements.

#### Weather as a source of interference

The detection area of surface-mounted motion sensors can be reduced by weather conditions like snow or rain. Plan this in when positioning the sensors.

#### Positioning of presence sensors

Presence sensors are positioned centrally above a workplace or work cluster. A movement across the sensor is detected best, while approaching it head-on is least effective.

By selectively covering certain segments of the lens, sources of interference such as trees or similar moving sources can be hidden.

#### False alarms caused by heat sources

Local heat sources like radiators can lead to false alarms. Reducing the sensitivity or the use of mask lenses can reduce their impact.

# Selection guide outdoors
