# Environmental Data Program

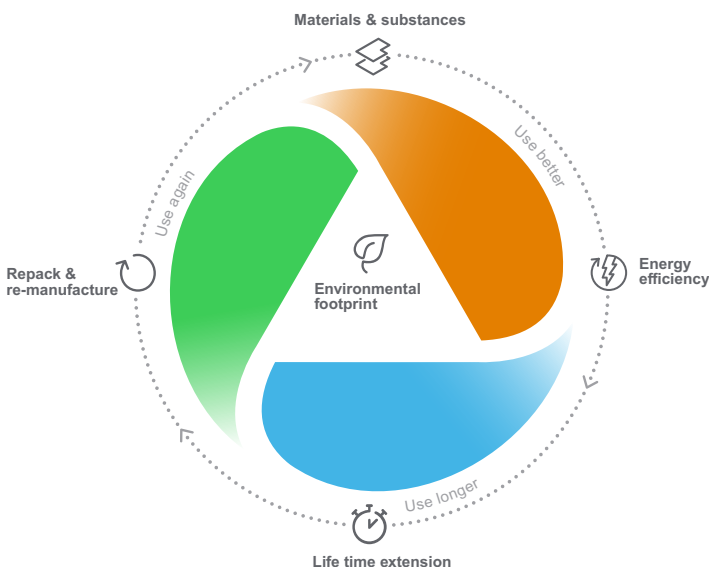

## Next-level transparency for better-informed product choices

The Environmental Data Program is a framework for how we measure, categorize, and compare the environmental attributes and footprint of our products.

Using a rigorous, fact-based methodology, the program provides environmental data from across the product lifecycle.

Five data categories across the product lifecycle

**Use Better:** How sustainable a product is, including environmental footprint, materials and substances, packaging, and energy efficiency.

**Use Longer:** How a product's life time can be effectively extended in terms of repairability and updatability.

**Use Again:** How a product can be reused, from dismantling and remanufacturing to recyclability and manufacturer take back.

With this transparent, verified data, customers and partners are empowered to make conscious environmental choices and accurately evaluate and report on sustainability performance.

Go to se.com to check our hardware offers which is associated with environmental data.

Learn more about the **Environmental Data Program**

# Legal Information

The information provided in this catalog contains description of Schneider Electric products, solutions and services (offer) with technical specifications and technical characteristics of the performance of the corresponding offer.

The content of this document is subject to revision at any time without notice due to continued progress in methodology, design, and manufacturing.

To the extent permitted by applicable law, no responsibility or liability is assumed by Schneider Electric and its subsidiaries for any type of damages arising out of or in connection with

(i) informational content of this catalog not conforming with or exceeding the technical specifications

(ii) any error contained in this catalog

(iii) any use, decision, act or omission made or taken on basis of or in reliance on any information contained or referred to in this catalog.

SCHNEIDER ELECTRIC MAKES NO WARRANTY OR REPRESENTATION OF ANY KIND, WHETHER EXPRESS OR IMPLIED, AS TO WHETHER THIS CATALOG OR ANY INFORMATION CONTAINED THEREIN SUCH AS PRODUCTS AND SERVICES WILL MEET REQUIREMENTS, EXPECTATIONS OR PURPOSE OF ANY PERSON MAKING USE THEREOF.

Schneider Electric brand and any trademarks of Schneider Electric and its subsidiaries referred to in this catalog are property of Schneider Electric or its subsidiaries. All other brands are trademarks of their respective owners.

A transfer switching equipment is indispensable:

For critical applications in particular  
For all others in general

A transfer switching equipment is indispensable for applications that need a continuous supply of electric power (hospitals, airports, banks, government facilities, etc.).

However transfer switching equipment is also suitable for LV electrical installations exposed to:

- > **Nominal voltage loss or dip (when there is high demand for electric power)**
- > **Unpredictable power quality**

> **Frequent power cuts**

These factors, and many others, can damage the continuity of service of your electrical installation.

For infrastructure managers, a source-changeover system gives direct economic benefits. It is possible to select your source based on power cost.

In this case, the replacement source is used as an alternative, more economical source.

- > **Managing energy efficiently**
- > **Power Cost**
- > **Safety**

# Where backup supply must be reliable: now that is everywhere

Electricity is the fuel that feeds economic activity. Very few operations can withstand the financial impact of an electrical stoppage.

For occupant comfort, business continuity, and worker/visitor safety, dependability levels that used to apply to hospitals or airports are now becoming required in shopping malls and offices.

Additionally, utility companies make their contracts more sophisticated to deal with energy concerns. For example, including time restrictions to total accessible power.

For these reasons, backup power sources expand across all types of buildings, and require high performance connection and management.

**Enabling you to meet these challenges, TransferPacT comes as the natural continuation of the high performance low voltage distribution system developed by Schneider Electric.**

**\$740 000**

average cost per event of  
unplanned downtime in a  
data center

Source

# 3 ways to switch the load to meet your needs

①

## Automatic Source-Changeover System (or ATSE: Automatic Transfer Switching Equipment)

An automatic controller may be added to a remote-operated source-changeover system. It is possible to automatically control source transfer according to programmed (dedicated controllers) or programmable (PLC) operating modes. These solutions support to optimum energy management.

### System

Derived ATSE: Two or three circuit breakers that may have different configurations, linked by an electrical interlocking system. A mechanical interlocking system protects more reliable than electrical malfunctions or incorrect manual operations, with an automatic control system (dedicated controllers or PLC).

Non-derived ATSE: Specifically designed ATSE with a specific controller for the system. A mechanical interlocking system is standard for product which protects more reliable than electrical malfunctions or incorrect manual operations.

②

## Manual Source-Changeover System (or MTSE: Manual Transfer Switching Equipment)

A very simple way to switch the load. It is controlled manually by an operator. The time required to switch from the 'N' source to 'R' source can vary.

### System

Two or three mechanically interlocked manually-operated circuit breakers or two switch-disconnectors.

③

## Remote-Operated Source-Changeover System (or RTSE: Remote Transfer Switching Equipment)

The commonly used system for devices with high ratings. Source-changeover is controlled electrically.

### System

Derived RTSE: Two or three circuit breakers that may have different configurations, linked by an electrical interlocking system. In addition, a mechanical interlocking system protects reliable than electrical malfunctions or incorrect manual operations.

Non-Derived RTSE: Specifically TSE that is electrically operated and not self-acting. A mechanical interlocking system is standard for product which protects more reliable than electrical malfunctions or incorrect manual operations.

## Applications

**Commercial and service sector industry and infrastructure** (operating rooms in hospitals, safety systems for buildings, computer rooms for banks and insurance companies, lighting and emergency lighting systems in malls, etc.)

**Buildings and infrastructure** where the need for continuity of service is significant but not a priority: offices, small and medium-sized businesses.

**Industry** like assembly lines, engine rooms on ships, critical auxiliaries in thermal powerstations, etc.

**Infrastructure** like port and railway installations, runway lighting systems, control systems on military sites, etc.

# Our expertise, benefit your system!

For many years Schneider Electric's source changeover system have proved their reliability around the world, in power dependable buildings. Switching is performed by ComPacT or MasterPacT circuit breakers, the references in industrial switchgear.

## Improve Continuity of Service

- > Energy availability is supporting external requirements (e.g. high power demand).
- > Maintenance and replacement of the sources (N or R) can be done with reliability of service.

You can maintain a continuous level of service and customer satisfaction.

## Safety and Continuity

For LV electrical installations where safety and continuity of service are critical for people and/or equipment such as hospitals, airports, banks, malls, etc.

## Optimized Energy Management

- > Transfer the load to a replacement source according to external requirements.
- > Manage power sources according to power quality and power costs.
- > Perform system regulation.
- > Switch to an emergency replacement source.

## Simplicity and Reliability

- > Simple installation on LV switchboard.
- > Optimized size of the switchboard.
- > System based on pre-tested components.
- > Compliance with IEC 60947-6-1.

### Definition of Class PC

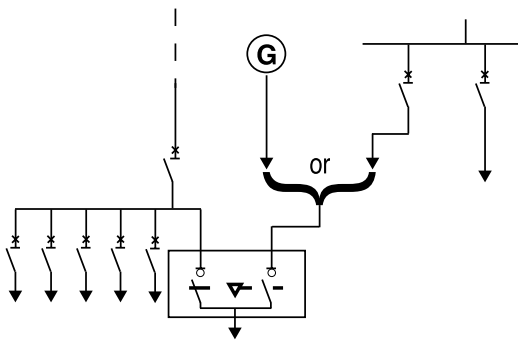

Transfer switch equipment based on mechanical switching devices, that do not need electrical power to hold the main contacts open or closed. They are capable of making, carrying, and breaking currents under normal circuit conditions including operating overload conditions, and making and withstanding short-circuit currents.

### Definition of ATSE (Automatic Transfer Switching Equipment)

Self-acting transfer switching equipment, including all necessary sensing inputs, monitoring, and control logic for transferring operations.

TransferPacT automatic transfer switching equipment is a Class PC ATSE specially designed in accordance with IEC 60947-6-1 requirements for power transfer. It has great withstand capabilities to short circuits and reliable making, carrying and breaking capabilities. Thus keeping reliable connectivity of circuits.

It is an all in one, Non-derived ATSE.

# TransferPacT Class PC

TransferPacT is a high speed, comPacT, modular design intelligent automatic transfer switch that provides scalability and robust performance. It is a Class PC ATSE designed according to IEC 60947-6-1, available through 32 A to 1600 A, 2,3,4 pole with rated operating voltage through 208 V to 440 V\*.

\*Note: Voltage varies depending on different frame. For more information, see general feature section.

A

## Power availability

### Optimize uptime:

Innovative technology ensuring transfer is feasibility.

### Vast application:

Utilization category AC-33B without derating, fits complicated load types.

### Reliable under extreme condition:

Short circuit capabilities including short time withstand current for your power continuity.

### Robust design – Extreme Environment Proof:

- Advance electromagnetic protection, fit for industry applications.
- Designed to perform in harsh environments
- Successfully passed testing in compliance with IEC 60068-2-6 and IEC 60068-2-27.

## Efficiency

### Easy installation:

- Built-in DPS and sensing wire, save commissioning time.
- Multiple installation adapted. E.g. DIN rail for 32 A ~160 A (TA10, TA16).

### Enhanced scalability:

- 10 function modules plug and play, non-disruption upgrading.

## Connectivity

### Natively connected-integrated in EcoStruxure™ Power

- 24/7 precise power monitoring on voltage, frequency, voltage unbalance, phase rotation.

## Cyber security

Designed according to cyber security standard IEC 62443 at the level of SL1.

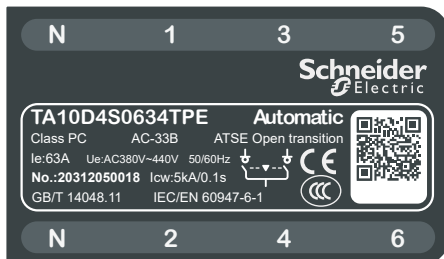

## Sustainability

### Green premium ecolabel.

- Green Package for full product range.
- Saving trees - Scan QR code for full version for technical documents.

# General Features

## Codes and Standard

- IEC 60947-1 General rules
- IEC 60947-6-1 Transfer switching equipment
- GB 14048.1 General rules
- GB/T 14048.11 Transfer switching equipment

## Certifications and Declarations

- CB certification
- CE certification
- CCC certification
- UKCA declaration

## Environmental Conditions

- TransferPacT ATSE can operate in an ambient temperature of  $-25\text{ }^{\circ}\text{C} \sim +70\text{ }^{\circ}\text{C}$
- The altitude of the installation site shall not exceed 2000 m
- When the highest temperature is  $+55\text{ }^{\circ}\text{C}$ , the relative humidity in air shall not exceed 95%
- Storage temperature:  $-40\text{ }^{\circ}\text{C} \sim +85\text{ }^{\circ}\text{C}$

## Vibration and Shock

- Tests are carried out in compliance with IEC 60068-2-6 and IEC 60068-2-27

## Electromagnetic Compatibility (EMC)

- EMC Class A
- EMI Class B
- Electrostatic discharge Level 4
- Radio-frequency electromagnetic field Level 3
- Fast transient bursts Level 4
- Surges Level 4
- Harmonic wave Level 3
- Voltage dips and short-time interruptions Level 3

## Degree of Pollution

- Pollution degree 3 as defined by IEC standard 60947

# Controller General Features

TransferPacT provides advanced microprocessor controller with two options:

- Active automatic HMI (LCD display and keypad)
- Automatic HMI (Rotary and DIP switch).

It is a robust and reliable controller which offers voltage, frequency, control, timing and diagnostic functions required for wide range of power application.

Automatic HMI is easy to install and use, while active automatic HMI contains every function needed with eight control modes.

## There are two key breakthroughs for TransferPacT controller:

- Active automatic HMI and automatic HMI can be swapped, that means an easy way to upgrade your controller, or replace it for maintenance or renewal.
- 10 types of function modules can be installed on TransferPacT controller, at any time, which provides maximum scalability and a reduced total cost of ownership, since you can add a function as demand grows.

NOTE: The LED indicator on the equipment and the external HMI is for reference. In the event of a contradiction between the LED and the mechanical indication, the latter prevails

# Control Mode and Transfer Logic

## Transfer Switching Equipment 32–1600 A

### Overview

The control mode is used to operate TSE in different applications. The TransferPacT Active automatic contains every function needed with nine control modes:

- Auto mode
- Test mode
- Communication transfer mode
- Voluntary transfer mode
- Local control mode
- Transfer inhibit mode
- Fire protection mode
- Force to off mode
- Handle transfer mode

The TransferPacT Automatic contains below control modes:

- Auto mode
- Test mode
- Voluntary transfer mode
- Transfer inhibit mode
- Fire protection mode
- Force to off mode
- Handle transfer mode

### Priority of Control Mode

Type of mode	Handle	Force	Fire	Inhibit	Local	Voluntary	Comm	Test	Auto
Handle transfer mode	-	I	I	I	I	I	I	I	I
Force to off mode	x	-	I	I	I	I	I	I	I
Fire protection mode	x	x	-	I	I	I	I	I	I
Transfer inhibit mode	x	x	x	-	I	I	I	I	I
Local control mode	x	x	x	x	-	I	I	I	I
Voluntary transfer mode	x	x	x	x	x	-	I	I	I
Comm transfer mode	x	x	x	x	x	x	-	I	I
Test mode	x	x	x	x	x	x	x	-	I
Auto mode	x	x	x	x	x	x	x	x	-

- = No caution

I = Interrupt

X = Ignore

# Control Mode and Transfer Logic

## Transfer Switching Equipment 32–1600 A

### Auto Control Mode

ATSE works on auto control mode normally. The controller monitors the real time values of both the sources. When there is source contingency, the transfer action will be energized to keep the power continuity for critical source.

Auto mode supports U-G or U-U applications.

**NOTE:** Auto transfer will not be active, if transfer action damages driving system (for example, both are out of range, TSE refuses to transfer).

There are two types of auto control mode:

- Auto-return
- Non-return

Naming	Condition for Stay on A Situation Return	
power source definition	N available	N available
	A available	A unavailable
Auto-return	Switch to N	Switch to N
Non-return	Stay at A	Switch to N

### Auto return

The Auto return has two modes:

- When the voltage on the N source exceeds the threshold (over voltage, under voltage, over frequency, under frequency) or does not exist, the ATSE will be transferred to the A source.
- When the voltage on the N source is within the threshold range, the ATSE will be transferred to N source.

The process of transfer can be controlled by time delay.

- T6 will reset if N becomes unavailable
- During T6, if A is not available it will keep to count T6 if the rest time of T6 is shorter than T2. Other wise it goes to T2

# Control Mode and Transfer Logic

## Transfer Switching Equipment 32–1600 A

### Non-Return

In the non-return mode, after auto transfer to replacement, the ATSE will be connected to the alternate source until:

- An external order is given to transfer back to N source.
- The alternate source is out of range. In such case, the ATSE controller will transfer back to the N source to maintain power availability.

There will be only one time power off, when there is normal power outage.

### Communication Control Mode

The communication control function allows TSE to transfer or test through communication. The switch can refuse to respond if the action will damage the driving system. It cannot transfer to unavailable source either.

The communication control function can be enabled/disabled through Active Automatic HMI (only available for TransferPacT Active Automatic transfer switch equipment).

To use the communication control successfully, at least one Modbus module should be installed and activated.

**NOTE:** Communication control is OFF by default. Follow the instructions below to enable communication control.

### Transfer by Communication

#### Transfer Logic Overview

Transfer by communication support the following four commands:

- Comm to Normal Source
- Comm to Alternate Source
- Comm to OFF
- Comm to Exit

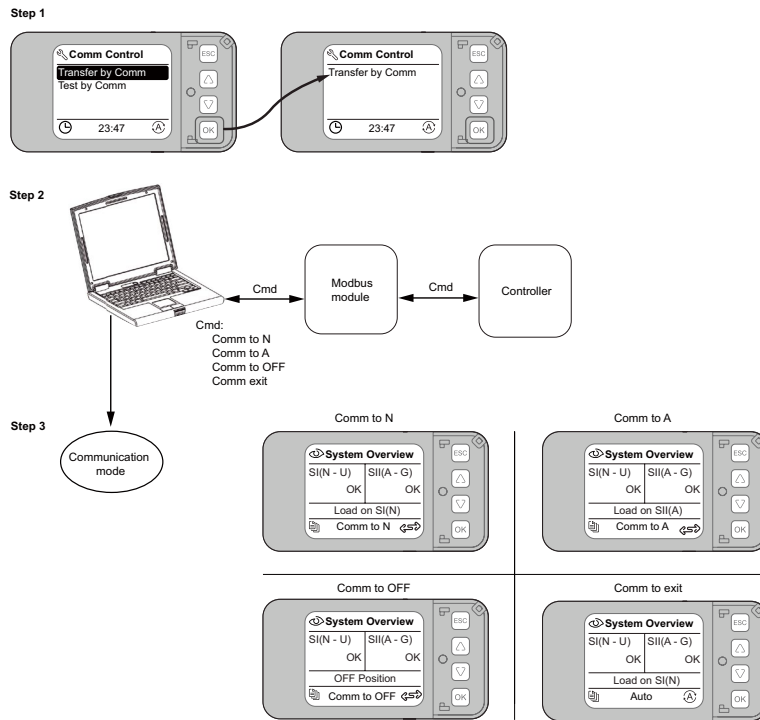

The command is sent through PC - Modbus. Comm to N/A is equivalent to the voluntary transfer mode on the transfer result. Comm to OFF is equivalent to local control to Off, but not equivalent to force to Off. The ATSE will transfer to OFF after receiving the command without any time delay.

When more than one Modbus modules are installed, the ATSE will only respond to the module which will send the command first. It will not response to any command from other modules until the first module sends the Exit command.

# Control Mode and Transfer Logic

## Transfer Switching Equipment 32–1600 A

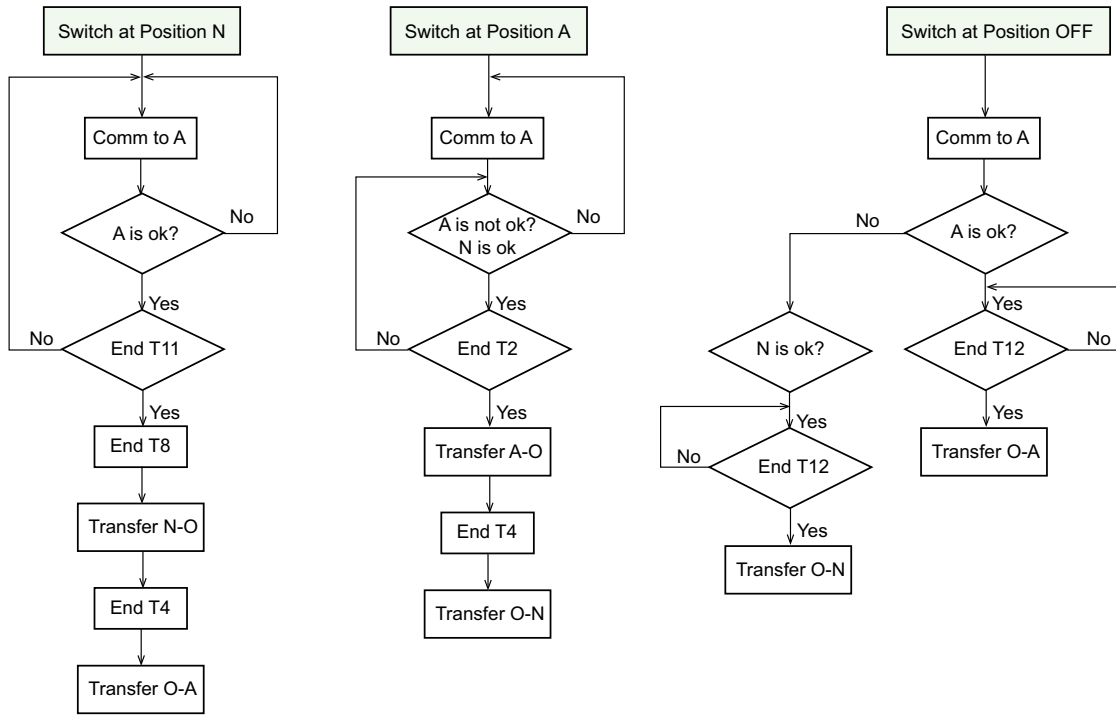

### Exit Communication Control Mode

There are three ways to exit communication control mode:

- The Modbus master device sends the Exit command to the active Modbus module installed on ATSE.
- Turn off Transfer by Comm from active automatic HMI.
- The active Modbus module is offline.

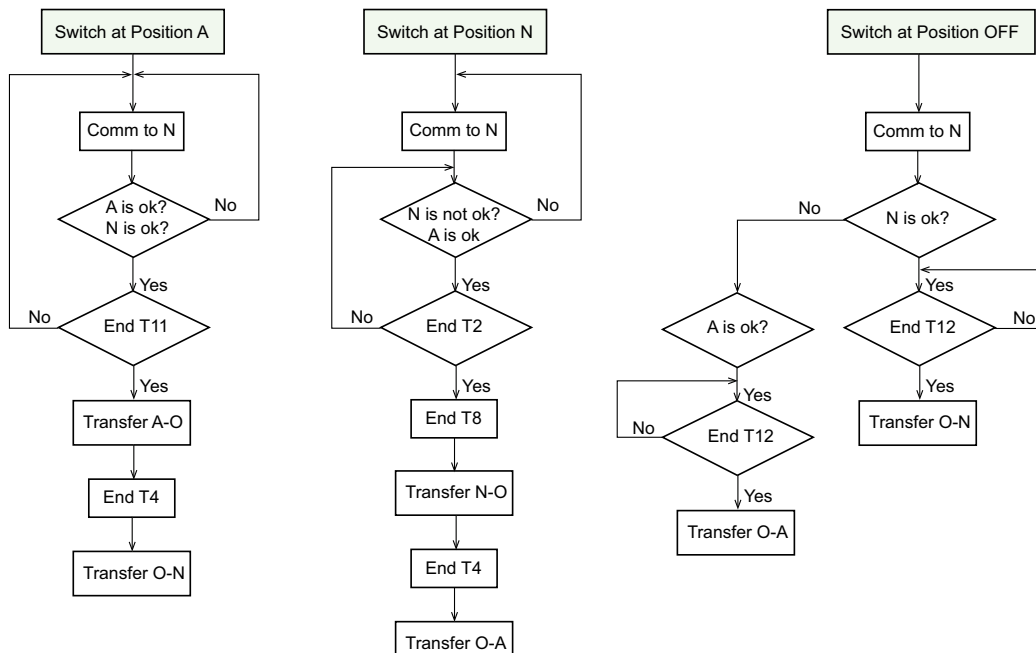

# Control Mode and Transfer Logic Transfer Switching Equipment 32–1600 A

## Transfer Logic of Communication to A (U-U Application)

\* T11 is internal fixed time delay

## Transfer Logic of Communication to N (U-U Application)

\* T11 is internal fixed time delay

# Control Mode and Transfer Logic

\* T11 is internal fixed time delay

# Control Mode and Transfer Logic

## Transfer Switching Equipment 32–1600 A

### Transfer Logic of Communication to N (U-G Application)

\* T11 is internal fixed time delay

### Transfer Logic of Communication to Off

Comm to OFF is equivalent to local control to off in Local Control Mode, but different to Force to Off Mode. The ATSE will transfer to off after receiving the command without any time delay. For more information, see Local Control Mode, page A-44.

# Control Mode and Transfer Logic

## Transfer Switching Equipment 32–1600 A

### Test by Communication

Transfer by communication that supports the following three commands:

- On Load Test
- Off Load test
- Test Exit

When more than one Modbus modules are installed, the ATSE will only respond to the module which send the command first. It will not respond to any command from other modules until the first module sends the Exit command.

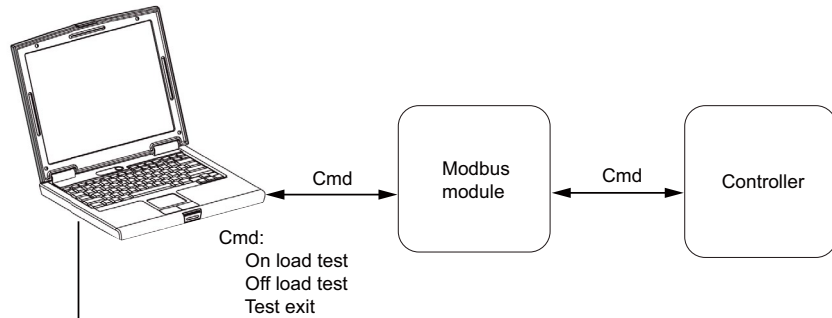

When the test is ongoing, ATSE ignores any other interface signal from active automatic HMI or DI module (TPCDIO07).

The operation of Test by communication is equivalent to Test mode. For more information, see Test Mode, page A-37.

#### Step 1

#### Step 2

#### Step 3

### Stop Test by Communication

There are three ways to exit communication control mode:

- The Modbus master device send Test Exit command to the active Modbus module installed on ATSE.
- Turn off Test by Comm from active automatic HMI.
- The active Modbus module is offline.

# Control Mode and Transfer Logic

## Transfer Switching Equipment 32–1600 A

### Voluntary Transfer Mode

The voluntary transfer mode is equivalent to auto-priority mode on one source, with forced priority to the SI or SII source. It is activated when associated input is closed (the commercial reference number for the voluntary control module is TPCDIO08). It takes over 200 ms to activate the voluntary mode. The signal for voluntary transfer should be constant.

Voluntary transfer is normally used for special tariffs. Once the mode is set from voluntary to N or A, ATSE still remains in auto mode. When there is power contingency on target source, transfer switch can re-transfer to available source automatically.

**NOTE:** Auto transfer will not be active, if transfer action damages driving system (for example, both source are out of range, TSE refuses to transfer).

The following are the voluntary transfer mode use cases:

#### Use Case 1: Typhoon Mode

During typhoon or earthquake, the Genset will be more stable than utility. The user for this case has installed a typhoon mode switch on his control panel. The user will activate the typhoon mode switch. It is connected to the input voluntary transfer mode which will transfer to alternate source (need accessory to have function of voluntary transfer using TPCDIO08 accessories). The ATSE will now activate the Genset output and will transfer to Genset once ready.

Now during the typhoon, the Genset is flooded. The ATSE will still be in auto mode. It detects alternate source failure. If the normal source is fine, it will try to transfer to normal source (voluntary is still an auto mode, and we have auto-return). If the normal source is not available then ATSE will not do any transfer. Still during typhoon, the Genset can restart (it was a fuel level problem). As the typhoon mode switch is still enabled, the ATSE will transfer back to the Genset. The Genset output keeps activated.

So, whatever the source is connected, the typhoon is gone. The utility is back to normal. The user will deactivate the typhoon mode switch. The ATSE will transfer back to normal source at auto mode with auto-return, U-G.

The configuration needed is a ATSE along with voluntary transfer module. With this configuration, the user don't need to play with any ATSE settings (return mode, priority source, what is the normal source).

#### Use Case 2: Peak Tariff (Align with Controller UA/BA)

Initially this feature was created in UA BA in France for Special Tariff Fare (STF) capability. Special Tariff Fare (STF) in France is a special electricity pricing that allows to have discount price on low consumption hours, with the drawback of having a very expensive kWh price on peak hours. With this option, EDF (French utility) provides an output on the energy meter to warn the end user about the price increase. This output is wired on the voluntary transfer input of the controller, which automatically transfers the load to a cheaper alternate source. This allows to help shedding the peaks on the network.

# Control Mode and Transfer Logic

## Transfer Switching Equipment 32–1600 A

### Test Mode

The test mode is a procedure to simulate the transfer process with following purpose:

- Test normal transfer actions for ATSE-On load test
- Test Genset-Off load test
- Test Genset-Transfer functions-On load test

### Ways to Start Test

There are three ways to conduct the test:

- Through Active Automatic HMI.
- Through DI using TPCDIO07 accessories.
- Through Modbus communication using TPCCOM16 module.

There is no priority among the test command from HMI, DI and Modbus. ATSE will act upon receiving the command from any way.

When the test is ongoing, ATSE ignores any other command until receiving the command to exit test.

Command to exit test should be sent through the same way used to start the test. Otherwise ATSE will not respond. For example, if you start the test through DI module, you have to stop the test through DI module as well.

### Default Time for Test

- Default as unlimited test (no time duration, has to stop the test manually).
- If you select limited test, the default time duration is 30 s.

### Time Range for Test

- 10 s–1800 s with steps of 1 s.
- Time delay can be bypassed by pressing ESC key in Active Automatic HMI.

### Pre-Condition to Start Test Mode

The following conditions are mandatory for the test:

- ATSE is in auto mode.
- ATSE is in normal position while in U to U Application.
- ATSE is in alternate position while in U to U Application.
- ATSE is in normal position while in U to G Application.
- For U-U application, R source shall be available before test. Otherwise, there will be an alarm.  
**NOTE:** On load test will not be active, if transfer action damages driving system (for example, both source are out of range, TSE refuses to transfer).

1. Source N is abnormal during the T7, T10, T2, T13, and T14 delay.
2. Interrupted by higher priority signals.
3. When not in the T8 and T4 phases, the controller terminates the current test after receiving the stop request.
4. The Onload test fails.

### Off Load Test

- The purpose of this function is to check the Genset can start, without power interruption.

#### **NOTE:**

- This test does not check if the switch is able to make the transfer.
- The test is only available with U-G configuration.
- The off load test should not be proposed, when the ATSE doesn't have Genset output feature.
- This function will only be accessible for product with HMI, as the Test mode default value is On load.
- The orders from higher priority will interrupt the test procedure.

# Control Mode and Transfer Logic

## Transfer Switching Equipment 32–1600 A

### Off Load Test

### T14 is Unlimited

### T14 is Limited

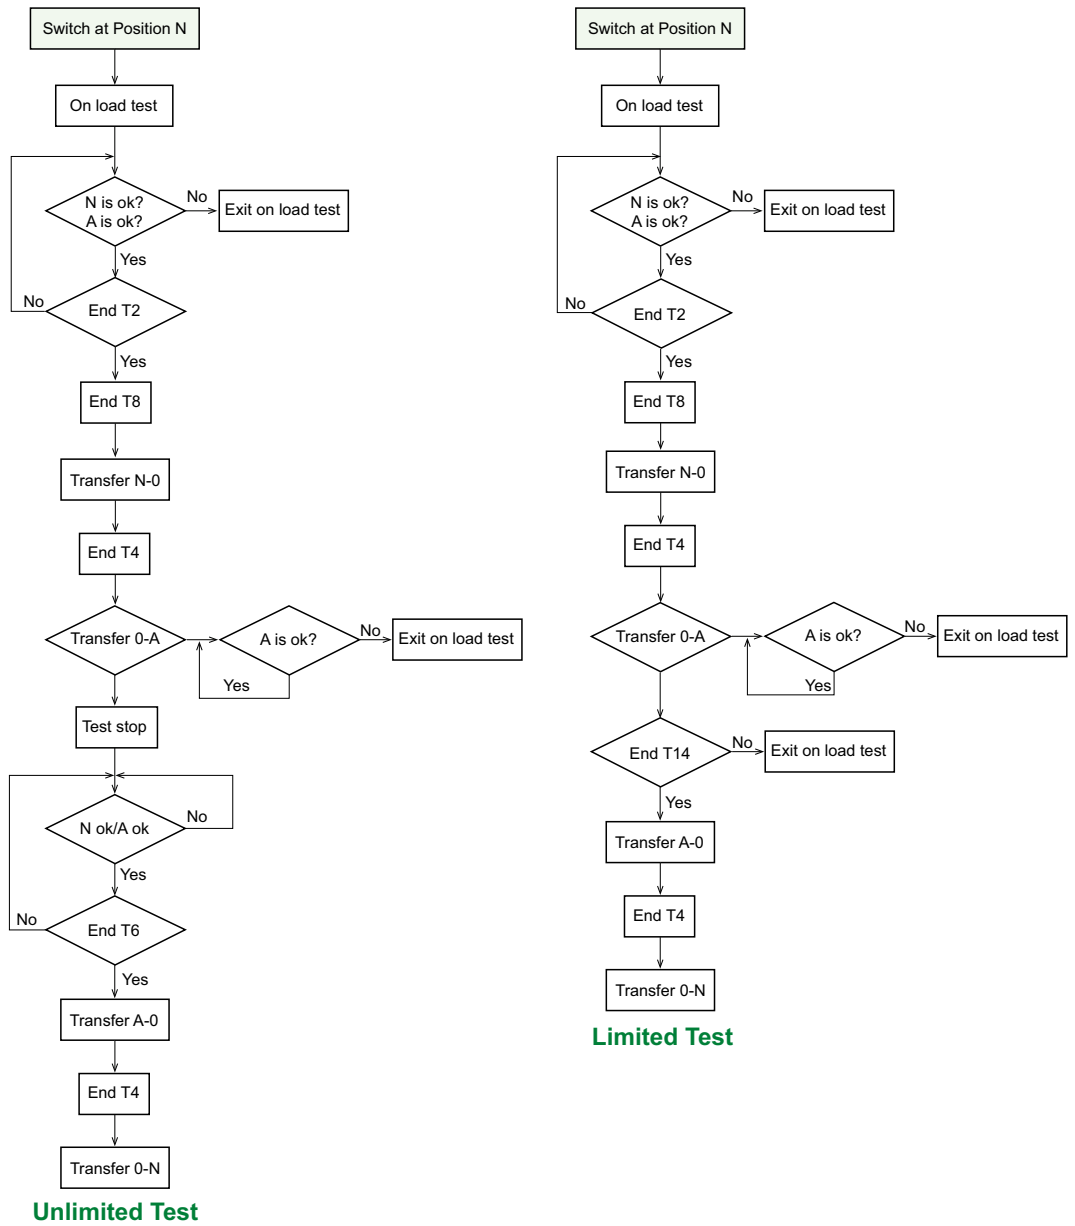

### On Load Test

- The purpose of this function is to execute ATSE transfer (when the source is still valid) to make sure the system is still able to execute the transfer. The UU and U-G configuration are both available.
- When the ATSE receive the testing start request:
  - The ATSE shall initiate the transfer to the Alternate source if the Alternate source is in range, and according to the transfer delays (T7, T2...).
  - The ATSE shall log a test start event.
- Two conditions to return to N source:
  - When the ATSE receive the stop request from user.
  - When the Test timer is activated, and the test timer is completed.

## Return or Start from Auto Mode at Off Position

When switch is at OFF position, this state is interim, and it happens under two conditions:

- Enter the auto mode from other modes or from power on.
  - End of off delay (T4), ATSE is unable to switch to N or A, due to both power source loss (with 24 V).
- The load shedding will be activated from OFF to A source in both U-U and U-G configuration.

\* T12 is internal fixed time delay.

# Control Mode and Transfer Logic

## Transfer Switching Equipment 32–1600 A

### Local Control Mode

#### ⚠ CAUTION

##### HAZARD OF EQUIPMENT DAMAGE

Enable the local control through Active Automatic HMI to exit the auto mode.

**Failure to follow these instructions can result in injury or equipment damage.**

#### NOTICE

##### POTENTIAL POWER OUTAGE OF EQUIPMENT

To re-enter Auto mode, disable local control through Active Automatic HMI or External HMI.

**Failure to follow these instructions can result in equipment damage.**

The local mode is activated through the HMI (only available for Active Automatic, RS version change to Automatic). It allows locally to change the logical position of the TSE. The switch will refuse to active if the action will damage the driving system. It cannot transfer to unavailable source.

**NOTE:** Local transfer will not be active, if transfer action damage driving system (for example, both overvoltage are out of range, TSE refuses to transfer) or both sources are out of operating voltage of solenoid.

Auto Genset start signal and load shedding signal is not available for this mode. In this case, the target source conformity is verified before transfer and time delays are not considered.

A

# Control Mode and Transfer Logic Transfer Switching Equipment 32–1600 A

### Local Control to N

The command is sent through HMI. There is no time delay except OFF delay. The switch will transfer to normal after receiving the order to it when normal power is in tolerance.

### Local Control to A

The command is sent through HMI. There is no time delay except OFF delay. The switch will transfer to alternate after receiving the order to it when alternate power is in tolerance.

### Local Control to O

The command is sent through HMI. There shall be no time delay. The switch will transfer to OFF after receiving the order to it.

# Control Mode and Transfer Logic

## Transfer Switching Equipment 32–1600 A

### Transfer Inhibit Mode

When the transfer inhibition input is active, the controller can not send any order to TSE. Front face selection buttons are locked and the HMI only displays transfer inhibit.

Fire, Force to OFF and Handle mode still works as before. When exit Fire, Force to OFF and Handle mode, transferring blocked by transfer inhibit.

Use this mode only when inhibit signal (from DI) is active and no higher operation mode is running. When ATS transfer is ongoing, wait until transfer completed.

Exit this mode after inhibit signal is inactive.

Accessories are required using TPCDIO07 to extend this function of the TSE.

### Application

- Transfer inhibit occurs when there is power interruption because of short circuit.
- This function can be used to lock the controller by customized signals.
- This function can be used for cooperation with different ATSE.

### Fire Protection Mode

- An emergency stop order to transfer ATSE to off position. All the other transfer mode will be canceled except force to OFF and handle control. There shall be no time delay.
- Exit fire protection after signal disappeared.
- Require accessories TPCDIO10 or TPCDIO11 or TPCDIO13 or TPCDIO14 to extend this function.

### Application

- The fire protection signal can transfer ATSE to off position when there is fire emergency.

### Force to OFF Mode

- Transfer ATSE to OFF position with an emergency stop order. All the other transfer mode will be canceled except handle control. There should be no time delay.
- Exit Force after signal disappeared.
- Accessories are required using TPCDIO07 to extend this function of TSE.

### Handle Transfer Mode

- The handle or manual transfer mode is activated from the TSE directly. It deactivates the controller control function except position status (outputs and LEDs), source status LEDs and alarm LED.
- No operation for load shedding and generator, keep the status as before.
- No alarm relay output.

# Controller Accessories

## Load Shedding and Availability Warning

### Function:

#### Load shedding

- The emergency power (Genset) sometimes may not afford all loads. A signal from controller will shed some non-critical loads
- Load shedding will send the signal after enabling this function

#### Availability warning output

- When transfer switch is not in auto or power lost on two sources, a dry contact will output the signal
- After back to Auto status or power recovery, the signal will be stopped

Compatibility: Active Automatic and Automatic

Rating: 250 VAC, 5 A or 30 VDC, 5 A

Digital output

## Transfer Inhibit and Remote Testing

### Function:

#### Transfer inhibit

- Transfer Inhibit when there is power interruption because of short circuit
- This function can be used to lock the controller by customized signals
- This function can be used for cooperation with different ATSE
- Remove transfer inhibit signal to Exit this mode

#### Remote testing

- Remote testing is an input signal to start test procedure.
- The remote test can only be started at Auto mode
- For Active Automatic HMI, on load, off load test and time duration can be selected.
- For Automatic HMI, on load test is unlimited.

Compatibility: Active Automatic and Automatic

Dry Contact

Digital input

## Voluntary Remote Control

### Function:

#### Voluntary transfer to N or A

- Voluntary transfer is an active input. It can transfer the ATSE to Normal or Alternate source according to requirements (such as energy saving)
- Voluntary transfer will still keep the power continuity as much as possible. The function will be bypassed if target source loses the power. For example, after voluntary to A while A source failed, ATSE will transfer back to N if N is available
- Exit voluntary mode after signal disappeared

#### Force to Off

- An emergency stop order to transfer ATSE to off position. All the other transfer mode will be canceled except handle control
- Exit Force after signal disappeared

Compatibility: Active Automatic and Automatic

Dry Contact

Digital input

# Controller Accessories

## Fire Protection

### Function:

The fire protection signal can transfer ATSE to off position when there is fire emergency.

- Fire protection with input of DC24 V pulse signal. Input Voltage: 24 VDC (-20% ~ +20%), Maximum Input Current: 10 mA
- Fire protection with input of DC24 V Constant signal. Input Voltage: 24 VDC (-20% ~ +20%), Maximum Input Current: 10mA
- Fire protection with input of AC230 V Constant. Input Voltage: 230 VAC (-20% ~ +20%), 50 Hz/60 Hz Maximum Input Current: 10 mA
- Fire protection with 1 input, dry contact

Compatibility: Active Automatic and Automatic  
Digital input

## BUS Extension and 24 VDC Auxiliary Supply Connection Port

### Function:

#### BUS extension

- Can be used to connect external HMI

#### DC 24V Auxiliary Supply Connection Port

- For controller when both source failure
- To keep power for Modbus communication when both source failure

Compatibility: Active Automatic

Rating: Input Voltage: 24 VDC (-20% ~ +20%), Maximum Input Current: 1 A

**Note:** This device is for user to connect auxiliary power supply.

## Modbus RTU (Serial Port)

### Function:

#### Modbus

- Can be used to connect with other system
- Require External 24 V or at least one main source to keep communication
- With Protocol Modbus RTU communication

Compatibility: Active Automatic

## Genset Start and Alarm

### Function:

#### Genset start output

- When utility source is lost, a dry contact will start Genset. No matter with or without external 24 V, a time delay (T7) before genset start can be set
- When Utility source has recovered, and ATSE has transferred back to Utility, Genset signal will remain until end of Genset cooldown timer

#### Alarm

- When there is critical alarm, a dry contact will output the signal
- Restart controller (open and close dielectric door) to shut down the Alarm

Compatibility: Active Automatic and Automatic

Rating: 250 VAC, 5 A or 30 VDC, 5 A

Digital output

**Note:** The alarm signal is irrelevant to generator start or stop. It is relevant to transfer errors and phase rotations (for Active automatic version only) errors, for more detail, refer to DOCA0214EN

## Source Indication

### Function:

#### Source availability output

This function is used for checking source I and source II status. User can wire indicators to this function module to check source availability without needs to open panel or wire external HMI. It provides two types of output for each source: Source I/II in range output and Source I/II out of range output.

Compatibility: Active Automatic and Automatic

Dry Contact

Digital input

Natively Supplied with TransferPacT Active

Natively Supplied with TransferPacT Active

# Controller Accessories

## External HMI

- Door mounted HMI provide exact same function as TransferPacT active automatic HMI Including status display, settings, event log, control transfer switch.It consists of an install base and LCD display, IP40. TPCCIF04

## IP54 Cover

- Optional accessory, Protective cover for external HMI for outdoor installations. TPCOTH37 or TPCOTH38(economic solution).

## HMI Cable

Used to connect the TSE and external HMI. 2\*RJ45 port.

- TRV00810: cable length is 1 m
- TRV00820: cable length is 2 m
- TRV00830: cable length is 3 m

## Energy Sensor

- Function: provides accurate real-time measurements and energy values.
- Application: for Frame 250 4P,downstream( load side) only. neutral be on left. LV434021

#### External HMI

#### Overview

The external HMI is used to display the HMI on the panel. The HMI consists of external HMI base and a LCD screen.

The external HMI must be connected with the function module with commercial reference as TPCDIO15. The connection of the external HMI is done using a cable and an external HMI base and LCD display.

#### Position of External HMI and Switch

Perform the following procedure to connect the external HMI on the panel door.

1. Rotate the external HMI to the back side.
2. Remove the nut of external HMI.
3. Insert the external HMI on the front door.

NOTE: Please make the cutout on the front door as per the dimension given.

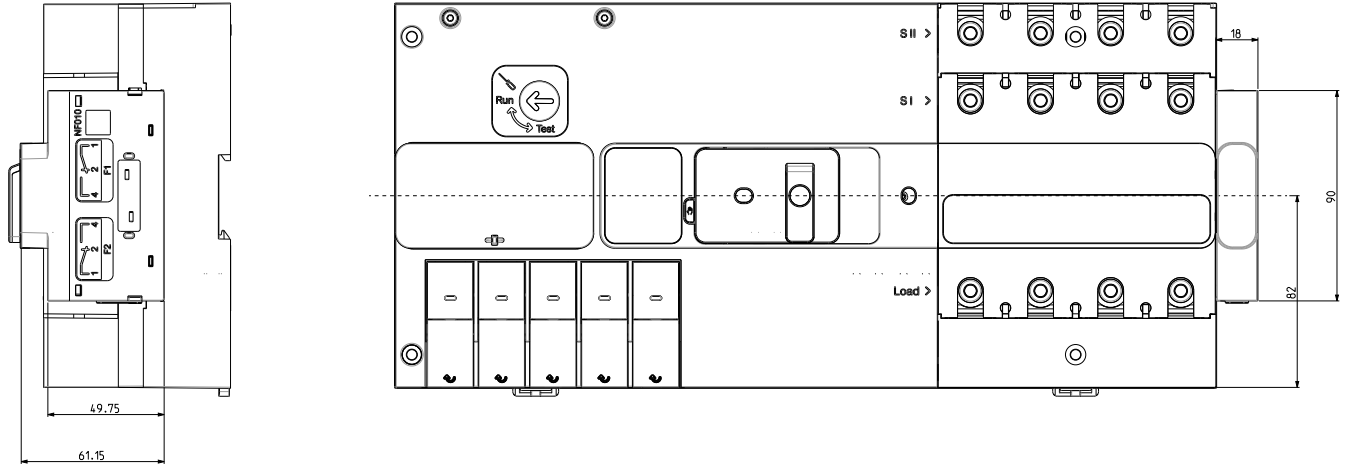

4. Insert the nut.
5. Lock the nut.
6. Insert the cable into the external HMI.
7. Insert the other end of the cable into the function module (TPCDIO15).

# Automatic Transfer Switching Equipment Function Module

	Maximum Qty per Product	Terminal Code	Terminal Definition
	1	LS1, LS2, LS4	loadshedding signal output
	1	AW1, AW2	Availability warning output
<b>TPCDIO05</b>			
	1	TI1, TI2	Transfer Inhibit signal input, short to work
<b>TPCDIO07</b>		RT1, RT2	Remote testing input, short to work
	1	V0, V1	Short to Transfer to Normal
<b>TPCDIO08</b>		V0, V2	Short to Transfer to Alternate
		V0, F1	Short to Transfer to OFF
	1	P1+, P1-	DC24 V pluse signal, enable fire protetion
<b>TPCDIO10</b>		P2+, P2-	DC24 V pluse signal, diable fire protection
	1	C1+, C1-	DC24 V constant signal, enable fire protetion
<b>TPCDIO11</b>		C1+, C1-	AC230 V constant signal, enable fire protetion
<b>TPCDIO13</b>	1	C1+, C1-	AC230 V constant signal, enable fire protetion
	1	W1, W2	Passive Signal, short to enable fire protetion
<b>TPCDIO14</b>			
	1	24 V+, 24 V-	DC 24 V external power port (auxiliary supply)
<b>TPCDIO15</b>		RJ45	Bus extension
	2	D1, D0, 0V	Modbus communication port
<b>TPCCOM16</b>			
	1	G1, G2, G4	Genset start signal output
	1	A1, A2	Alarming output
<b>TPCDIO17 (1)</b>			
	1	S12, S11, S14	Power availability indication for Source I
<b>TPCDIO19</b>		S22, S21, S24	Power availability indication for Source II

**NOTE:** for detailed function module terminal definition and default settings, refer to user guide DOCA0214EN  
(1) both V1& V2 are okay to use.

# Automatic Transfer Switching Equipment Auxiliary Contact

**TPSAUX32**

**TPSAUX43**

**TPSAUX71**

When installed on left side

- Ⓐ SI open
- Ⓑ SI closed
- Ⓒ SII open
- Ⓓ SII closed

Transfer switching equipment is closed at SI:

- F11-F14 is closed
- F11-F12 is opened

Transfer switching equipment is closed at SII:

- F21-F24 is closed
- F21-F22 is opened

Transfer switching equipment is at OFF position:

- F11-F12 and F21-F22 are closed
- F11-F14 and F21-F24 are opened

**TPSAUX33**

**TPSAUX44**

**TPSAUX72**

Transfer switching equipment is at OFF position:  
F12-F22 is closed

Transfer switching equipment is not at OFF position:  
F11-F14 and F21-F24 are closed

**NOTE:** terminal capacity for auxiliary contact is AC250 V 2 A.

# Automatic Transfer Switching Equipment Auxiliary Contact

**TPSAUX71**

**TPSAUX71 When installed on right side**

- (A) SII open
- (B) SII closed
- (C) SI open
- (D) SI closed

Transfer switching equipment is closed at SI:

- F21-F24 is closed
- F21-F22 is opened

Transfer switching equipment is closed at SII:

- F11-F14 is closed
- F11-F12 is opened

Transfer switching equipment is at OFF position:

- F21-F22 and F11-F12 are closed
- F21-F24 and F11-F14 are opened

**Note:** Only TPSAUX71 has different definition when installed on different sides.

## RTSE: Remote Transfer Switching Equipment

(Non-derived RTSE, PC Type)

### Definition of Class PC

Transfer switch equipment based on mechanical switching devices, that do not need electrical power to hold the main contacts open or closed and capable of making, carrying, and breaking currents under normal circuit conditions including operating overload conditions, and making and withstanding short-circuit currents.

### Definition of RTSE(Remote Transfer Switching Equipment)

Transfer switching equipment that is electrically operated and not self-acting.

It is the most commonly used system for transfer loads without direct human intervention. Transfer process is conducted electrically. In some occasions, you want to use a third-party system to control the TSE from distance (such as control room), or users want to use an intelligent system to operate the TSE, which requires remote control functions.

TransferPacT Remote is a class PC, solenoid drive all in one RTSE.

TransferPacT RTSE has intelligent control with CPU integrated in switch, it is designed to manage the transfer according to the incoming command of the third party. It can work with third party system, like generator-set controllers, PLCs etc.

# General Features

## Power Availability

**Vast application:**

Utilization category AC-33B without derating, fits complicated load types.

**Reliable under extreme condition:**

Short circuit capabilities including short time withstand current for your power continuity.

**Robust design – Extreme Environment Proof:**

- Advance electromagnetic protection, fit for industry applications.
- Designed to perform in harsh environments
- Successfully passed testing in compliance with IEC 60068-2-6 and IEC 60068-2-27.

## Efficiency

**Easy installation:**

- Built-in DPS and sensing wire, save commissioning time.

**Easy Operation:**

- Simple reliable mechanism, manual and remote operation available
- Input and output terminals to provide product status and operation
- Wide voltage range for multiple grid: 208 VAC-240 VAC, 380 VAC-440 VAC.

## Sustainability

**Green premium ecolabel.**

- Green package for full product range.
- Saving trees - Scan QR code for full version for technical documents.

## Cyber security

Designed according to cyber security standard IEC 62443 at the level of SL1.

# General Features

Besides the terminals for I/O signals, it also provides power and product state and alarm indication through LED indicator on product front face. TransferPacT Remote is designed to manage the transfer according to the incoming command of the third party. It can work with third party system, like generator-set controllers, PLCs etc.

## HMI Description

B

Label	Description
G	Power status indicator
E	Alarm status indicator

LED Indication	Status	Description
		Both sources are out of range, or the transfer switch equipment is in manual/lock mode
		Either source is in range and transfer switch equipment is in RUN mode
		No alarm
		Alarm is active (Transfer failure, transfer switch equipment contact position failure, internal error occurred)

# Electrical and Mechanical Accessories - Frame 250

# Electrical and mechanical accessories - Frame 250

## Auxiliary Contact Module

- TPSAUX43: provide the open and closed status indication for both source I and source II .
- TPSAUX44: provide the open and closed status indication for OFF position.

## Insulating Accessories

### Terminal Shield

Optional accessory, provide terminal protection on the cable incoming and output.

- LV429518: Terminal shield (set of 1)

### Interphase Barrier

Optional accessory, provide protection for the cable incoming and output, effectively avoiding short circuits between phases.

- TPSISO65: Interphase barriers (set of 3)

### Insulation Screen

Optional accessory, provide protection for the cable incoming and output.

- TPSISO66: Insulating screen. Applicable for source II only, maximum 1 set.

# Terminal Definition and Transfer Process

## Terminal Definition

TransferPacT Remote provides transfer solutions with input and output terminals.

Description	Terminal label	Definition
Product Availability	P0	Common Terminal for P1,P2
	P1	Output signal, when either source voltage is in range and product is NOT in manual mode, NO terminal will close.
	P2	Output signal, when either source voltage is in range and product is NOT in manual mode, NC terminal will open.
Remote Transfer	R0	Common Terminal for R1,R2,R3
	R1	Passive input signal, remote transfer to position I when closed with R0 and last for at least 200ms.
	R2	Passive input signal, remote transfer to position II when closed with R0 and last for at least 200ms
	R3	Passive input signal, remote transfer to position O when closed with R0 and last for at least 200ms

## Remote Transfer Process

The RTSE transfers to a stable position after receiving a rising edge signal. The rising edge signal should last for no less than 200 ms.

The RTSE will remain on the stable position until receiving a new signal. It will not respond to the new signal when:

- Position slider is in the left and transfer switch equipment is in RUN mode.
- Transfer switch equipment is in alarm state.
- Transfer switch equipment is executing the transfer action.

■ : No requirement on the signal voltage level. It can either be high or low level.

# Switching Devices

## M

### Complete Source-changeover Assembly (or MTSE: Manual Transfer Switching Equipment)

#### Definition of Class PC

Transfer switch equipment based on mechanical switching devices, that do not need electrical power to hold the main contacts open or closed and capable of making, carrying, and breaking currents under normal circuit conditions including operating overload conditions, and making and withstanding short-circuit currents.

#### Definition of Derived TSE

TSE based on switching devices that have certain tests required for compliance with IEC 60947-6-1 as defined in Table 9, covered by IEC 60947-3 for Class PC, IEC 60947-2 or IEC 60947-6-2 for Class CB, or IEC 60947-4-1 for Class CC

#### Definition of MTSE (Manual Transfer Switching Equipment)

Manually operated transfer switching equipment, transfer switching equipment operated manually and non-electrically.

#### TransferPacT FXM is a Class PC, Derived MTSE (Complete Source-Changeover Assembly)

These assemblies provide an easy way to implement source changeover functions with:

- A single 3-position rotary handle that controls the two switch-disconnectors (Normal source ON, OFF, Replacement source ON)
- A smaller size, taking up less room in the switchboard.

A complete source changeover assembly can be ordered with a single catalog number.

# Manual, Remote and Automatic Transfer Switch

Schneider Electric offers source change-over systems based on ComPacT and MasterPacT devices. They are made of up to 3 circuit breakers or switch-disconnectors linked by an electrical interlocking system that may have different configurations. Moreover, a mechanical interlocking system must be added to protect against electrical malfunctions or incorrect manual operations. In addition, a controller can be used for automatically control the source transfer.

The following pages present the different solutions for mechanical and electrical interlocking and associated controllers.

## M

### Manual Source-Changeover System

(or MTSE: Manual Transfer Switching Equipment)

## R/A

### Remote-Operated Source-Changeover System

## Information

IEC 60947-6-1 applies to transfer switching equipment (TSE) to be used in power systems for transferring a load supply between a normal and an alternate source (other power supply or generator).

TSE is classified according to

- The method of controlling the transfer
  - Manually transfer switching equipment (MTSE)
  - Automatic transfer switching equipment (ATSE)
- their short circuit capability
  - Class PC: TSE that is capable of making and withstanding, but not intended for breaking short-circuit currents. Switch and switch-disconnectors are the most useful products used.

□ Class CB: TSE that is capable of making, withstanding, it's intended for breaking short-circuit currents and is provided with over-current releases. Circuit breakers (air circuit breaker or moulded-case circuit breaker) are the most useful products used.

## Interlocking by extended rotary handles

## Interlocking via device keylocks by captive keys

## Mechanical interlocking using connecting rods

## Mechanical interlocking by cables

## Mechanical interlocking by cables

[1] Implemented with NS630b to NS1600 electrically-operated devices only.  
 [2] For source-changeover systems using cables, always respect the installation conditions specified on.  
 [3] Not compatible with automatic controller.

**Note:** for other cases, please consult us.

# TransferPacT Mechanical Interlocking

PE113435.eps

Interlocking of two or three toggle-controlled devices.

## Interlocking of Two or Three Toggle-Controlled Devices

### Interlocking system

Two devices can be interlocked using this system. Two identical interlocking systems can be used to interlock three devices installed side by side.

Authorized positions:

- one device closed (ON), the others open (OFF)
- all devices open (OFF).

The system is locked using one or two padlocks (Ø5 to 8 mm).

This system can be expanded to more than three devices.

There are two interlocking-system models:

- one for ComPacT INS/INV
- one for ComPacT NSX100 to NSX250
- one for ComPacT NSX400 to NSX630.

### Combinations of Normal and Replacement devices

All toggle-controlled fixed or plug-in ComPacT NSX100 to NSX630 circuit breakers and switch-disconnectors of the same frame size can be interlocked. The devices must be either all fixed or all plug-in versions.

PE113415-N.eps

Interlocking of two devices by rotary handles.

## Interlocking of Two Devices By Rotary Handles

### Interlocking system

Interlocking involves padlocking the rotary handles on two devices which may be either circuit breakers or switch-disconnectors.

Authorized positions:

- one device closed (ON), the other open (OFF)
- both devices open (OFF).

The system is locked using up to three padlocks (Ø5 to 8 mm).

There are two interlocking-system models:

- one for ComPacT INS/INV
- one for ComPacT NSX100 to NSX250
- one for ComPacT NSX400 to NSX630.

### Combinations of Normal and Replacement devices

All rotary-handle fixed or plug-in ComPacT NSX100 to NSX630 circuit breakers and switch-disconnectors of the same frame size can be interlocked. The devices must be either all fixed or all plug-in versions.

PE113829.eps

Interlocking with keylocks.

## Interlocking of Devices by Keylocks (Captive Keys)

Interlocking using keylocks is very simple and makes it possible to interlock two or more devices that are physically distant or that have very different characteristics, for example medium-voltage and low-voltage devices or a ComPacT NSX100 to NSX630 switch-disconnector and circuit breaker.

### Interlocking system

Each device is equipped with an identical keylock and the key is captive on the closed (ON) device. A single key is available for all devices. It is necessary to first open (OFF position) the device with the key before the key can be withdrawn and used to close another device.

A system of wall-mounted captive key boxes makes a large number of combinations possible between many devices.

### Combinations of Normal and Replacement devices

All rotary-handle ComPacT NSX100 to NSX630 circuit breakers and switch-disconnectors can be interlocked between each other or with any other device equipped with the same type of keylock.

# TransferPacT Mechanical Interlocking

## Interlocking of Two Devices by Base Plate

### Interlocking system

A base plate designed for two ComPacT NSX devices can be installed horizontally or vertically on a mounting rail. Interlocking is carried out on the base plate by a mechanism located behind the devices. In this way, access to the device controls and trip units is not blocked.

### Combinations of Normal and Replacement devices

All rotary-handle and toggle-controlled ComPacT NSX100 to NSX630 circuit breakers and switch-disconnectors can be interlocked. Devices must be either all fixed or all plug-in versions, with or without earth-leakage protection or measurement modules.

An adaptation kit is required to interlock:

- two plug-in devices
- a ComPacT NSX100 to NSX250 with an NSX400 to NSX630.

Connection to the downstream installation can be made easier using a coupling accessory.

### Downstream coupling accessory

This accessory simplifies connection to bars and cables with lugs. It may be used to couple two switch-disconnectors and circuit breakers of the same size, ComPacT INS/INV100 to 630 and ComPacT NSX100 to 630.

Pitch between outgoing terminals:

- ComPacT INS250 and INV100 to 250: 35 mm
- ComPacT INS/INV320 to INS/INV630: 45 mm
- ComPacT NSX100 to NSX250: 35 mm
- ComPacT NSX400 to NSX630: 45 mm.

For ComPacT NSX circuit breakers, the downstream coupling accessory can be used only with **fixed versions**.

## Connection and Insulation Accessories

The coupling accessory can be fitted with the same connection and insulation accessories as the circuit breakers and switch-disconnectors.

Possible uses	Downstream coupling	
	Possible mounting	Outgoing pitch (mm)
<b>Manual source-changeover systems</b>		
INS250 (100 to 250 A) with rotary handle		35

# TransferPacT Mechanical Interlocking

For implementing the mechanical interlocking, two different possibilities are offered:

- interlocking with rods
- interlocking with cables.

Note: for mechanical interlocking application with connecting rods and cables, pushbutton cover is mandatory to prevent wrong mechanical close order.

Commercial references for pushbutton cover:

- MasterPacT MTZ1 : LV833897
- MasterPacT MTZ2 and MTZ3 : LV848536
- ComPacT NS630b to 1600: 33897

## Interlocking with Rods

### Interlocking of Two ComPacT NS630b to 1600 Devices Using Connecting Rods

Both devices must be installed one above the other.

For ComPacT NS, only associations between similar type devices are allowed (2 fixed or 2 drawout devices).

#### Installation

This function requires:

- an adaptation fixture on the right side of each circuit breaker or switch-disconnector
- a set of connecting rods with no-slip adjustments.

The adaptation fixtures, connecting rods and circuit breakers or switch-disconnectors are supplied separately, ready for assembly.

The maximum vertical distance between the fixing plates is 900 mm.

#### Possible combinations of "S1" and "S2" source circuit breakers

Combinations are possible between ComPacT NS devices and between ComPacT NS devices with MasterPacT MTZ1 devices (either 2 fixed or 2 withdrawable/drawout devices).

### Interlocking of Two MasterPacT MTZ Using Connecting Rods

Both devices must be installed one above the other.

For MasterPacT MTZ1 only associations between similar type devices are allowed (2 fixed or 2 drawout devices).

For MasterPacT MTZ2 and MTZ3, all mixed associations between fixed type and drawout type devices are possible.

PB113491\_R\_34\_eps

Drawout								
NS630b to NS1600					●	●		
MTZ1					●	●		
MTZ2			●	●			●	●
MTZ3			●	●			●	●

#### Installation

This function requires:

- an adaptation fixture on the right side of each circuit breaker or switch-disconnector
- a set of connecting rods with no-slip adjustments
- a mechanical operation counter CDM (mandatory).

The adaptation fixtures, connecting rods, circuit breakers and switch-disconnectors are supplied separately, ready for assembly.

# TransferPacT Mechanical Interlocking

The maximum vertical distance between the fixing plates is 900 mm.

## Interlocking with Cables

### Interlocking of Two ComPacT NS630b to 1600 Devices Using Cables

For cable interlocking, the circuit breakers may be mounted one above the other or side-by-side.

The interlocked devices may be fixed or drawout, three-pole or four-pole, and have different ratings and sizes.

#### Installation

This function requires:

- an adaptation fixture on the right side of each device
- a set of cables with no-slip adjustments.

The maximum distance between the fixing plates (vertical or horizontal) is 2000 mm.

#### Possible combinations of “S1” and “S2” source circuit breakers

All mixed associations between ComPacT NS 630b to 1600 and MasterPacT MTZ1 or MTZ2 or MTZ3 fixed type and drawout type devices are possible.

### Interlocking of Two or Three MasterPacT MTZ Using Cables

For cable interlocking, the circuit breakers can be installed either one above the other or side-by-side. All mixed associations between MasterPacT MTZ1, MTZ2, MTZ3 fixed type and drawout type devices are possible.

**Note:** mechanical interlocking for 3 devices is only possible with MTZ2 and MTZ3.

#### Interlocking between two MasterPacT MTZ1, MTZ2, MTZ3 devices

This function requires:

- an adaptation fixture on the right side of each device
- a set of cables without slip adjustments
- a mechanical operation counter CDM (mandatory).

The maximum distance between the fixing plates (vertical or horizontal) is 2000 mm.

#### Interlocking between three MasterPacT MTZ2, MTZ3 devices

This function requires:

- a specific adaptation fixture installed on the right side of each device
- two sets of cables without slip adjustments
- a mechanical operation counter CDM (mandatory).

The maximum distance between the fixing plates (vertical or horizontal) is 1000 mm.

#### Installation

The adaptation fixtures, sets of cables and circuit breakers or switch-disconnectors are supplied separately, ready for assembly.

Installation conditions for cable interlocking systems:

- cable length: 2.5 m
- cable bending radius: greater than 100 mm
- maximum number of curves: 3.

**Note:** for cable length higher than 2.5 m please consult us before ordering the circuit breakers for a customized solution.

## Choice Criteria

In applications where the continuity of service is critical<sup>[1]</sup> (data centers, airports, hospitals, marine, oil&gas, process industry, etc.), mechanical interlocking by rods and drawout devices are strongly recommended.

Mechanical interlocking by rods is preferred as less energy is consumed by friction, so it has less effect on the circuit breaker closing energy.

In terms of breaker mounting type, the drawout version is preferred as :

- it provides mechanical isolation of the circuit breaker from possible external stress on the terminals by having a flexible connection at cluster level
- it allows simple and total access for periodic maintenance
- it allows quick replacement of the device if necessary.

When not possible, cable interlocking or fixed versions can be used, but the installation rules detailed in the 2 sections below must be strictly respected and mainly:

- the busbars or the cables used for power connection must apply no stress on the circuit breaker terminals.

Their weight must be supported by the switchboard frame.

Interlocking of two MasterPacT circuit breakers using cables.

<sup>[1]</sup> For more details please contact your local support.

**Note:** for more details on installation rules, please also refer to “MasterPacT MTZ User Guide”.

# TransferPacT Electrical Interlocking - IVE unit

Electrical interlocking is used with a mechanical interlocking system. Moreover, the relays controlling the closing order to the "N" and "R" circuit breakers must be mechanically and/or electrically interlocked to prevent them from giving simultaneous closing commands.

Electrical interlocking is carried out by an electrical control device.  
 For ComPacT NSX up to 630 A, electrical interlocking is implemented by the IVE unit integrating control circuits and an external terminal block in accordance with the page D-47 of the chapter "Electric diagrams" of this catalog.  
 The integrated control circuits implement the time delays required for correct source transfer.  
 For ComPacT NS630b to NS1600 and MasterPacT, this function can be implemented in one of two ways:

- Using the IVE unit
- By an electrician based on the diagrams in accordance with the pages D-61 to D-70 of the chapter "Electric diagrams" of this catalog.

IVE unit.

### Characteristics of the IVE unit

- External connection terminal block:
  - Inputs: circuit breaker control signals
  - Outputs: status of the SDE contacts on the "N" and "R" source circuit breakers.
- 2 connectors for the two "N" and "R" source circuit breakers:
  - Inputs:
    - Status of the OF contacts on each circuit breaker (ON or OFF)
    - Status of the SDE contacts on the "N" and "R" source circuit breakers
  - Outputs: power supply for operating mechanisms.
- Control voltage:
  - 24 to 250 V DC
  - 48 to 415 V 50/60 Hz - 440 V 60 Hz.

The IVE unit control voltage must be same as that of the circuit breaker operating mechanisms.

### IVE Unit

### Symbols

- |   |                                       |
|---|---------------------------------------|
| QN: Normal ComPacT circuit breaker equipped for remote operation (motor mechanism)      | IN: Circuit breaker QN closing order  |
| QR: Replacement ComPacT circuit breaker equipped for remote operation (motor mechanism) | IR: Circuit breaker QR closing order  |
| ON: Circuit breaker QN opening order  | L1: Faulty Normal indication LED      |
| OR: Circuit breaker QR opening order  | L2: Faulty Replacement indication LED |

### Key

- O: OFF (circuit open)
- I: ON (circuit closed)
- : either ON or OFF.

**Note:** following all trips (overload, short-circuit, earth-leakage fault, voluntary trip), a manual reset on the front of the motor mechanism is required.

# TransferPacT Electrical Interlocking - IVE unit

## Necessary Equipment

**For ComPacT NSX100 to NSX630, each circuit breaker must be equipped with:**

- A motor mechanism
- An OF contact
- An SDE contact

The components are supplied ready for assembly and the circuit breakers prewired. The prewiring must not be modified.

**For ComPacT NS630b to NS1600, each circuit breaker must be equipped with:**

- A motor mechanism
- An available OF contact
- A CE connected-position contact (carriage switch) on withdrawable circuit breakers
- An SDE contact

**For MasterPacT MTZ, each circuit breaker must be equipped with:**

- A remote-operation system made up of:
  - MCH gear motor
  - MX or MN opening release
  - XF closing release
  - PF "ready to close" contact
- CDM mechanical operation counter (mandatory)
- An available OF contact
- One to three CE connected-position contacts (carriage switches) on drawout circuit breakers (depending on the installation).

ComPacT NSX

- A** Circuit breaker QS1 equipped with a motor mechanism and auxiliary contacts, connected to the N source
- B** Circuit breaker QS2 equipped with a motor mechanism and auxiliary contacts, connected to the R source
- C** Base plate with mechanical interlocking
- D** Electrical interlocking unit IVE
- E** Coupling accessory (downstream connection)

MasterPacT MTZ

# TransferPacT Controllers

## Controller Selection

By combining a remote-operated source-changeover system with an integrated BA or UA automatic controller, it is possible to automatically control source transfer according to user-selected sequences. These controllers can be used on source-changeover systems comprising 2 circuit breakers. For source-changeover systems comprising 3 circuit breakers, the automatic control diagram must be prepared by the installer as a complement to diagrams provided in the electrical diagrams section of this catalog.

[1] The controller is powered by the ACP control plate. The same voltage must be used for the ACP plate, the IVE unit and the circuit breaker operating mechanisms. If this voltage is the same as the source voltage, then the Normal and Replacement sources can be used directly for the power supply. If not, an isolation transformer must be used.

By combining a TransferPacT UC Controller with a TransferPacT UC Adaptor, it is possible to automatically control source transfer according to selected sequences. These controllers can be used on source-changeover systems comprising 2 circuit breakers.

# TransferPacT Controllers

## Controller Installation

### TransferPacT ACP Control Plate

The control plate provides in a single unit:

- protection for the BA or UA controller with two highly limiting P25M circuit breakers (infinite breaking capacity) for power drawn from the AC source
- control of circuit breaker ON and OFF functions via two relay contactors
- connection of the circuit breakers to the BA or UA controller via a built-in terminal block.

#### Control voltages

- 110 V 50/60 Hz.
- 220 to 240 V 50/60 Hz.
- 380 to 415 V 50/60 Hz and 440 V 60 Hz.

The same voltage must be used for the TransferPacT ACP control plate, the controller and the circuit breaker operating mechanisms.

#### Installation

Connection between the TransferPacT ACP control plate and the IVE unit may use:

- wiring done by the installer
- prefabricated wiring (optional).

### Installation of the BA and UA Controllers

The BA and UA controllers may be installed in one of two manners:

- directly mounted on the TransferPacT ACP control plate
- mounted on the front panel of the switchboard
- if the length of the connection between the controller and the control plate (ACP) is less than or equivalent to 1 m, the connecting cable **ref. 29368** can be ordered as an optional extra. Cables longer than 1 m, but not longer than 2 m will be the responsibility of the installer.

TransferPacT ACP control plate.

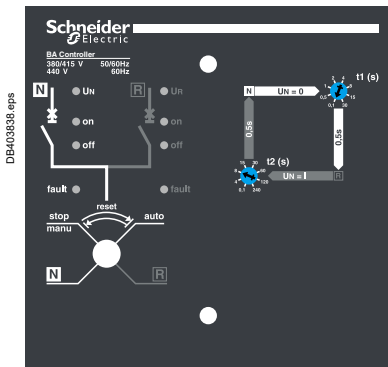

Mounting on the TransferPacT ACP control plate.

Mounting on the front panel of the switchboard.

The BA controller is used to create simple source-changeover systems that switch from one source to another depending on the presence of voltage  $U_N$  on the Normal source. It is generally used to manage two permanent sources and can control ComPact NS, ComPact NSX and MasterPacT MTZ circuit breakers and switch-disconnectors.

Front of the BA controller.

### Operating Modes

A four-position switch may be used to select:

- automatic operation
- forced operation on the Normal source
- forced operation on the Replacement source
- stop (both Normal and Replacement sources off).

### Setting the Time Delays

Time delays are set on the front of the controller.

**t1.** delay between detection that the Normal source has failed and the transmission of the order to open the Normal source circuit breaker (adjustable from 0.1 to 30 seconds).

**t2.** delay between detection that the Normal source has returned and the transmission of the order to open the Replacement source circuit breaker (adjustable from 0.1 to 240 seconds).

### Circuit Breaker Commands and Status Indications

The status of the circuit breakers is indicated on the front of the controller.

- ON, OFF, fault.

A built-in terminal block may be used to connect the following input/output signals:

- inputs:
  - voluntary order to transfer to source R (e.g. for special tariffs, etc.)
  - additional control contact (not part of the controller). Transfer to the Replacement source takes place only if the contact is closed (e.g. used to test the frequency of  $U_R$ , etc.)
- outputs:
  - indication of operation in automatic or stop mode via changeover contacts.

### Test

It is possible to test the operation of the BA controller by turning OFF (opening) the P25M circuit breaker for the Normal source and thus simulating a failure of voltage  $U_N$ .

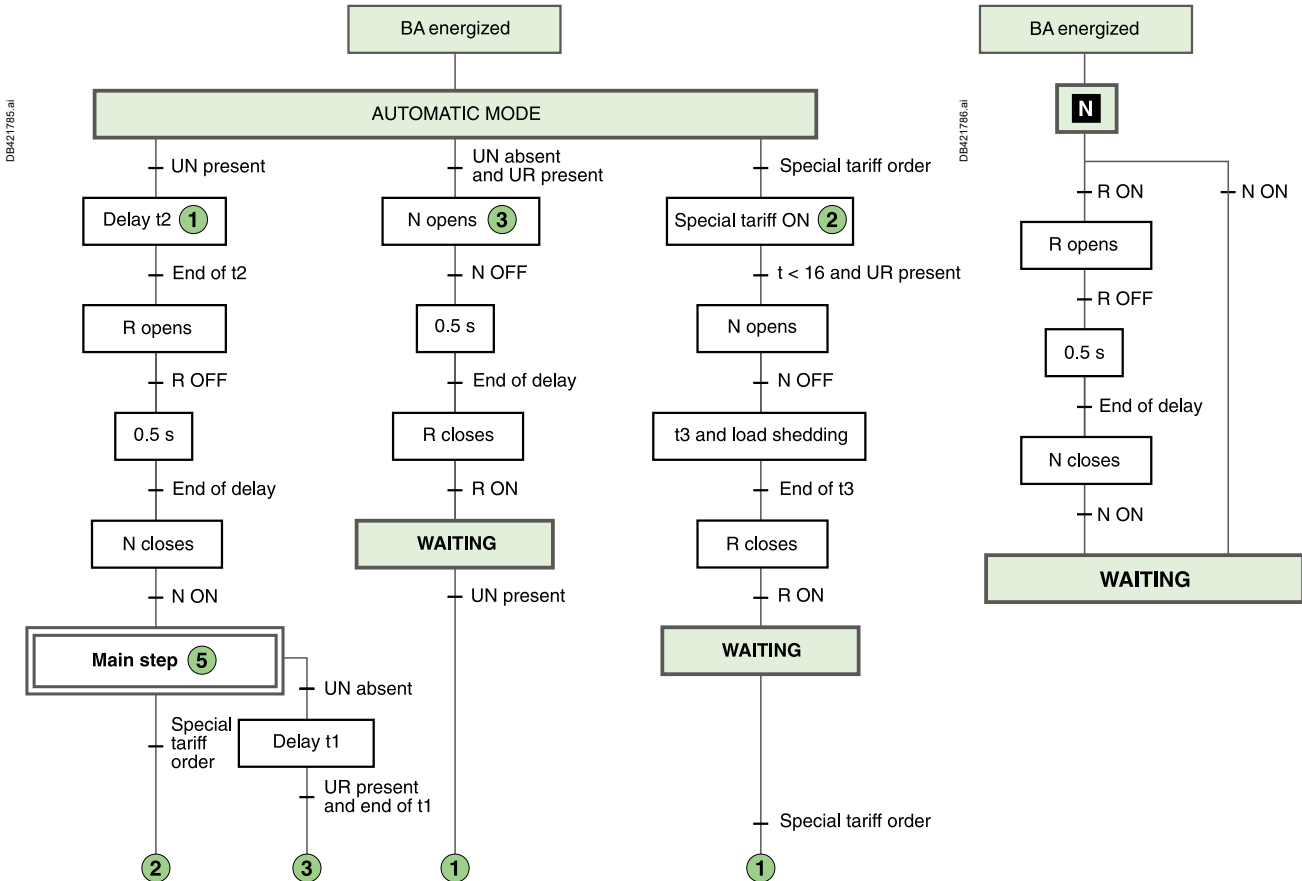

# TransferPacT Controllers

## BA Controller

### Operating Sequences

**Switch Set to Auto (automatic operation and special-tariff mode)**

**Switch Set to the "N" Position (forced operation on the Normal source)**

**Switch set to the "R" position (forced operation on the Replacement source)**

**Switch set to the "Stop" position**

**Key**

- UN: Normal source voltage
- UR: Replacement source voltage
- N : Normal source circuit breaker
- R: Replacement source circuit breaker

**WAITING**

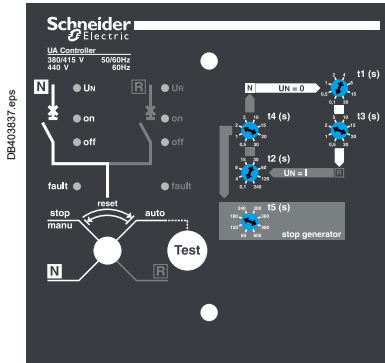

The system exits this mode when the operating mode is modified or when an external event occurs (e.g. failure or return of UN).

① The number sends to the indicated step when the condition is true.

The UA controller is used to create a source-changeover system integrating the following automatic functions:

- transfer from one source to another depending on the presence of voltage UN on the Normal source
- startup of an engine generator set
- shedding and reconnection of non-priority circuits
- transfer to the Replacement source if one of the phases on the Normal source fails.

The UA controller can control ComPact NS, ComPact NSX and MasterPacT MTZ devices.

Front of the UA controller.

### Operating Modes

A four-position switch may be used to select:

- automatic operation
- forced operation on the Normal source
- forced operation on the Replacement source
- stop (both Normal and Replacement sources off, then manual operation).

### Setting the Time Delays

Time delays are set on the front of the controller.

- t1.** delay between detection that the Normal source has failed and the transmission of the order to open the Normal source circuit breaker (adjustable from 0.1 to 30 seconds).
- t2.** delay between detection that the Normal source has returned and the transmission of the order to open the Replacement source circuit breaker (adjustable from 0.1 to 240 seconds).
- t3.** delay following opening of QN with load shedding and before closing of QR (adjustable from 0.5 to 30 seconds).
- t4.** delay following opening of QR with load reconnection and before closing of QN (adjustable from 0.5 to 30 seconds).
- t5.** delay for confirmation that UN is present before shutting down the engine generator set (adjustable from 60 to 600 seconds).
- t6.** delay before startup of the engine generator set (120 or 180 seconds).

### Commands and Indications

Circuit breaker status indications on the front of the controller:

- ON, OFF, fault.

A built-in terminal block may be used to connect the following input/output signals:

- inputs:
  - voluntary order to transfer to source R (e.g. for special tariffs, etc.)
  - additional control contact (not part of the controller). Transfer to the Replacement<sup>®</sup> source takes place only if the contact is closed (e.g. used to test the frequency of UR, etc.)
- outputs:
  - control of an engine generator set (ON / OFF)
  - shedding of non-priority circuits
  - indication of operation in automatic mode via changeover contacts.

### Distribution-System Settings

Three switches are used to:

- select the type of Normal source, whether single-phase or three-phase (e.g. 240 V single-phase or 240 V three-phase)
- select whether to remain (or not) on the Normal source if the Replacement source is not operational during operation on special tariffs
- select the maximum permissible startup time for the engine generator set during operation on special tariffs (120 or 180 seconds).

### Test

A pushbutton on the front of the controller may be used to test transfer from the Normal source to the Replacement source, then the return to the Normal source. The test lasts approximately three minutes.

**WAITING** The system exits this mode when the operating mode is modified or when an external event occurs (e.g. failure or return of UN).

When the UA controller is not energized, the output for generator set startup is activated).

**Key**

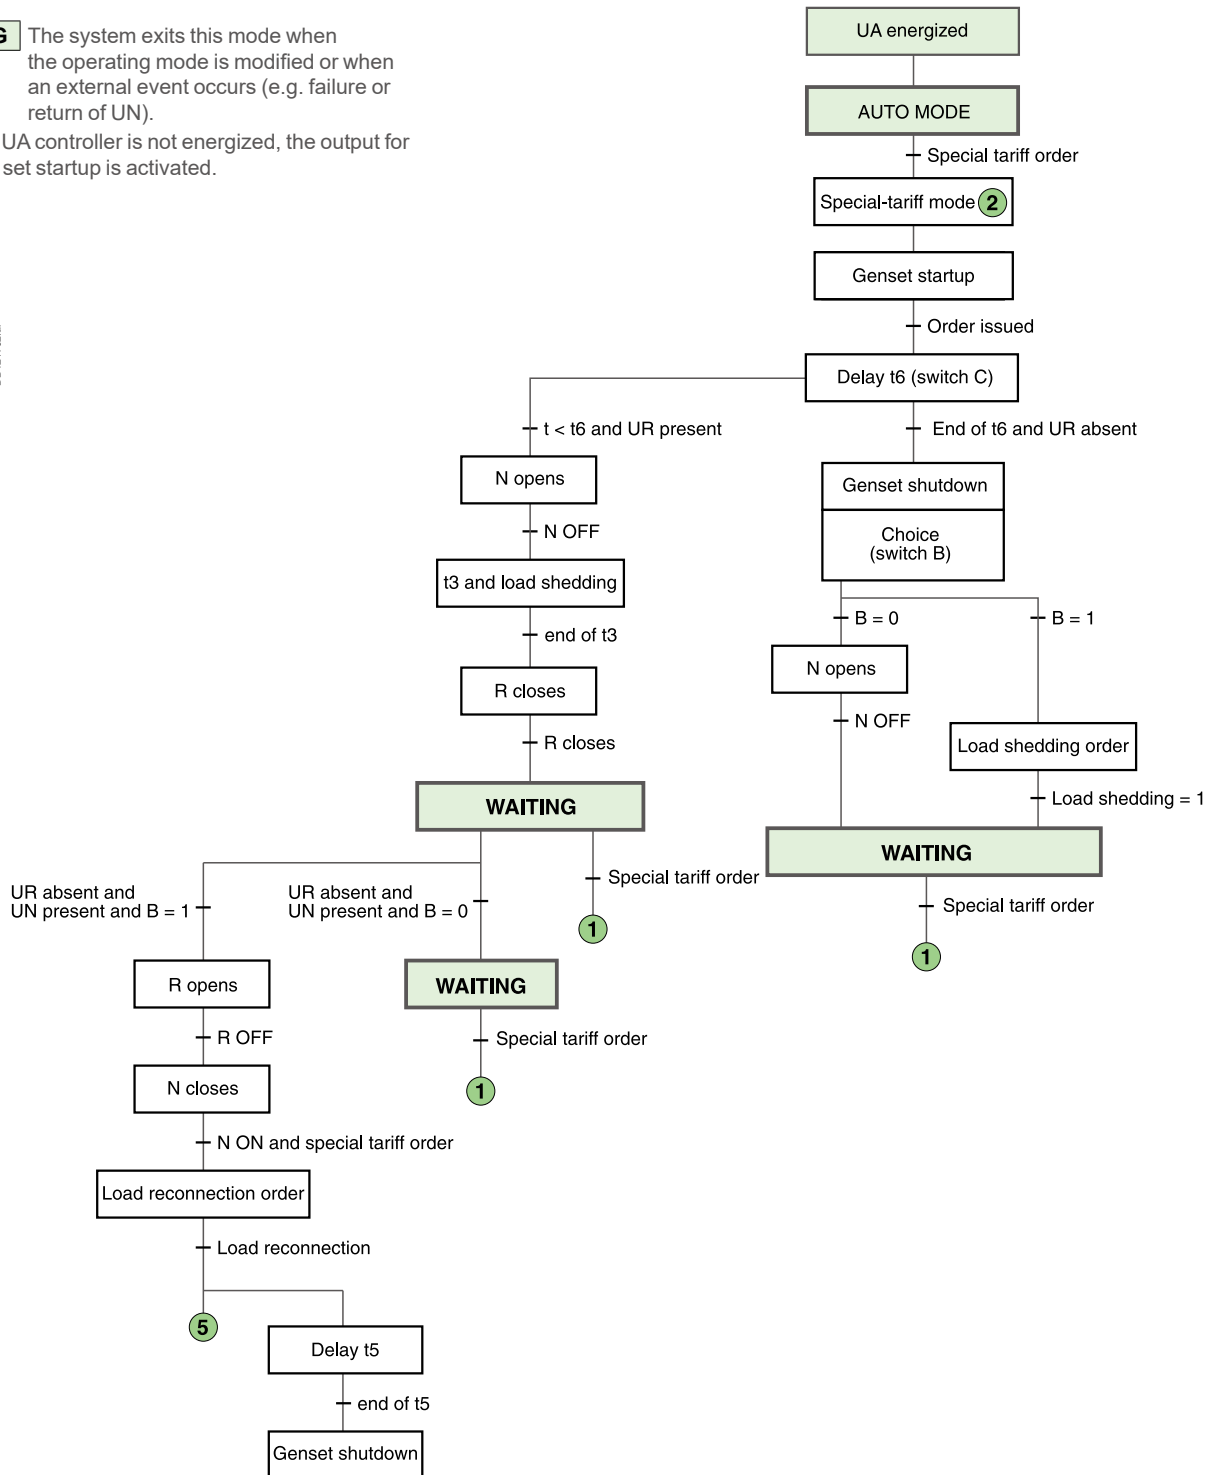

- UN: Normal source voltage
- UR: Replacement source voltage
- N : Normal source circuit breaker
- R: Replacement source circuit breaker

**Switch Set to the "Auto" Position (special-tariff mode)**

**WAITING** The system exits this mode when the operating mode is modified or when an external event occurs (e.g. failure or return of UN).

When the UA controller is not energized, the output for generator set startup is activated.

DB421762.ai

**Key**

- UN: Normal source voltage
- UR: Replacement source voltage
- N: Normal source circuit breaker
- R: Replacement source circuit breaker
- B: Penalties accepted (N ON), i.e. B = 1

① The number sends to the indicated step when the condition is true.

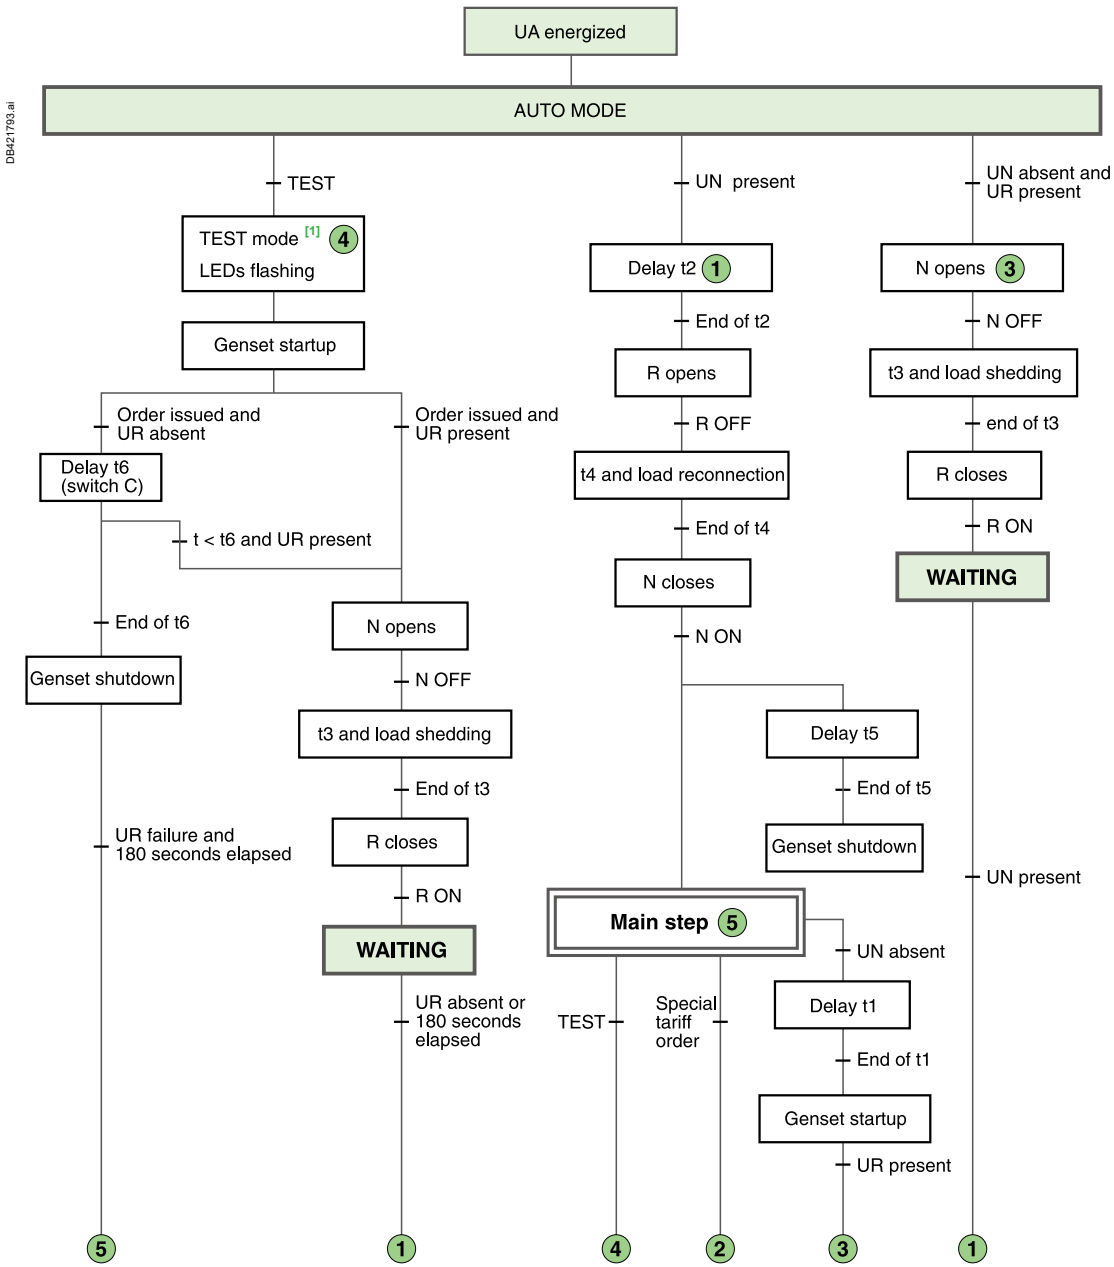

# TransferPacT Controllers

## UA Controller

### Operating Sequences, Test Mode and Automatic Operation

Switch Set to the "Auto" Position (automatic operation and test mode).

**WAITING** The system exits this mode when the operating mode is modified or when an external event occurs (e.g. failure or return of UN).

When the UA controller is not energized, the output for generator set startup is activated).

**Key**

- UN: Normal source voltage
- UR: Replacement source voltage
- N: Normal source circuit breaker
- R: Replacement source circuit breaker
- B: Penalties accepted (N ON), i.e. B = 1
- [1] The test lasts 180 seconds.

① The number sends to the indicated step when the condition is true.

**BA Controller**

**Inputs**

- UN: Normal source voltage
- UR: Replacement source voltage
- KT: order for forced-operation on R
- KR: additional check before transfer

**Outputs**

- QN: Normal source circuit breaker
- QR: Replacement source circuit breaker

**UA Controller**

**Inputs**

- UN: Normal source voltage
- UR: Replacement source voltage
- KT: order for forced-operation on R

**Outputs**

- KG: order to the genset
- SH: load-shedding order
- QN: Normal source circuit breaker
- QR: Replacement source circuit breaker

**Key**

- O: OFF (circuit open)
- I: ON (circuit closed)
- : either ON or OFF.

**Important**

If UR is not ON when the transfer order is issued (KT or UN), the sequence is not carried out. If KR status is not ON when the transfer order is issued (KT or UN), the transfer sequence is carried out later when KR status becomes I.

# TransferPacT Controllers

## UC Controller

### TransferPacT Adaptor

The control plate provides in a single unit:

- Protection for the UC controller with two highly limiting IC65H circuit breakers for power drawn from the AC source.
- Connection of the circuit breakers to the UC controller through a built-in terminal block.

#### Control voltages

- 208 to 230 V 50/60 Hz
- 380 to 415 V 50/60 Hz and 440 V 60 Hz

The same voltage must be used for the TransferPacT adaptor, the controller, and the circuit breaker auxiliaries.

#### Installation

Connection between the TransferPacT adaptor and the controller may use:

- Wiring done by the installer
- Prefabricated wiring

### Installation of the UC Controllers

The UC controllers can be installed as follows:

- Mounted on the front panel of the switchboard
- Cables between the adaptor and the controller are available in 2 sizes : 0.5 m and 2 m.

TransferPacT Adaptor

Mounting on the TransferPacT Adaptor with Bracket

Mounting on the front panel of the switchboard

The UC controller is used to create a source-changeover system integrating the following automatic functions:

- Transfer from one source to another depending on the presence or deviation (frequency, voltage) S1 on the normal source.
- Startup of an engine generator set.
- Shedding and reconnection of non-priority circuits.
- Transfer to the replacement source if one of the phases on the normal source missing.

The UC controller can control ComPacT NS, ComPacT NSX and MasterPacT MTZ devices.

- A Navigation button to return to previous page
- B Navigation button to scroll up
- C Navigation button to scroll down
- D OK button to confirm any status
- E S1 power status indicator
- F Contact position of S1
- G Contact position of S2
- H S2 power status indicator
- I Alarm status indicator
- J Not in Auto status indicator
- K Run status indicator
- L S1 trip indicator
- M S2 trip indicator
- N Local mode button
- O Transfer to S1 button
- P Transfer to OFF button
- Q Transfer to S2 button

## UC Controller

### Single Line Diagram LEDs

LED Indication	Status	Description
<b>Run</b>	-----	No energy, ATSE power off
		ATSE update in process or Test mode in progress
		ATSE in normal operation, ready to transfer
<b>Auto</b>	-----	ATSE in automatic mode
		ATSE not in automatic mode, and does not automatically transfer during source unavailability.
<b>Alarm</b>	-----	No alarm
		Alarm is active
<b>S1</b>	-----	No S1
		S1 out of range
<b>S2</b>	-----	No S2
		S2 out of range
<b>S1</b>	-----	S1 present and in the range
		S1 is opened (Not connected)
<b>S2</b>	-----	S2 present and in the range
		S2 is opened (Not connected)
<b>S1</b>	-----	Transfer in progress
		S1 is closed (Connected)
<b>S2</b>	-----	Transfer in progress
		S2 is closed (Connected)
<b>S1</b> <b>S2</b>	-----	No trip
		S1/S2 circuit breaker tripped
	-----	ATSE not connected to source 1
		ATSE connected to source 1
	-----	ATSE not in "O" position (both S1 and S2 are disconnected)
		ATSE in "O" position (both S1 and S2 are disconnected)
	-----	ATSE not connected to source 2
		ATSE connected to source 2

**Note:** The LED indicator on the equipment and the external HMI is for reference. In the event of a contradiction between the LED and the mechanical indication, the mechanical indication is considered the correct one.

## Overview

The control mode is used to operate TSE in different applications. The TransferPacT UC contains every function needed with seven control modes:

- Auto mode
- Test mode
- Communication transfer mode
- Voluntary transfer mode
- Local control mode
- Transfer inhibit mode
- Force to off mode

## Priority of Control Mode

- Fault (Trip, Transfer Failed, etc.)
- > Force to off mode
- > Transfer inhibit mode
- > Local control mode (Local manual button transfer)
- > Voluntary transfer mode (Voluntary to N or Voluntary to A transfer)
- > Communication transfer mode (Comm to N, Comm to A, or Comm to OFF transfer)
- > Test mode (On load test or Off load test)
- > Auto mode (Auto Return, Non Return, or Manual Return)

# TransferPacT Controllers

## UC Controller

### Auto Mode

Auto control mode is the standard operating mode. The controller monitors the real time power parameter of both sources and controls the switching devices as per pre-configured logic of both the sources.

Auto mode supports U-G (Untility - Generator) or U-U (Untility - Untility) applications.

There are three types of auto control mode:

- Auto-Return
- Non-Return
- Manual-Return

Naming	Transfer Logic	
power source definition	N available	N available
	A available	A unavailable
Auto-Return	Switch to N	Switch to N
Non-Return	Stay at A	Switch to N
Manual-Return*	Stay at A	Manual switch to N

\* **Note:** The transfer switch does not return automatically and requires manual operation to return to its normal position.

### Auto-Return

- When the voltage on the N(Normal) source exceeds the threshold (over voltage, under voltage, over frequency, under frequency) or does not exist, the ATSE transfers to the A(Alternate) source.
- When the voltage on the N(Normal) source is within the threshold range, the ATSE transfers to N(Normal) source. The process of transfer is controlled by time delay.

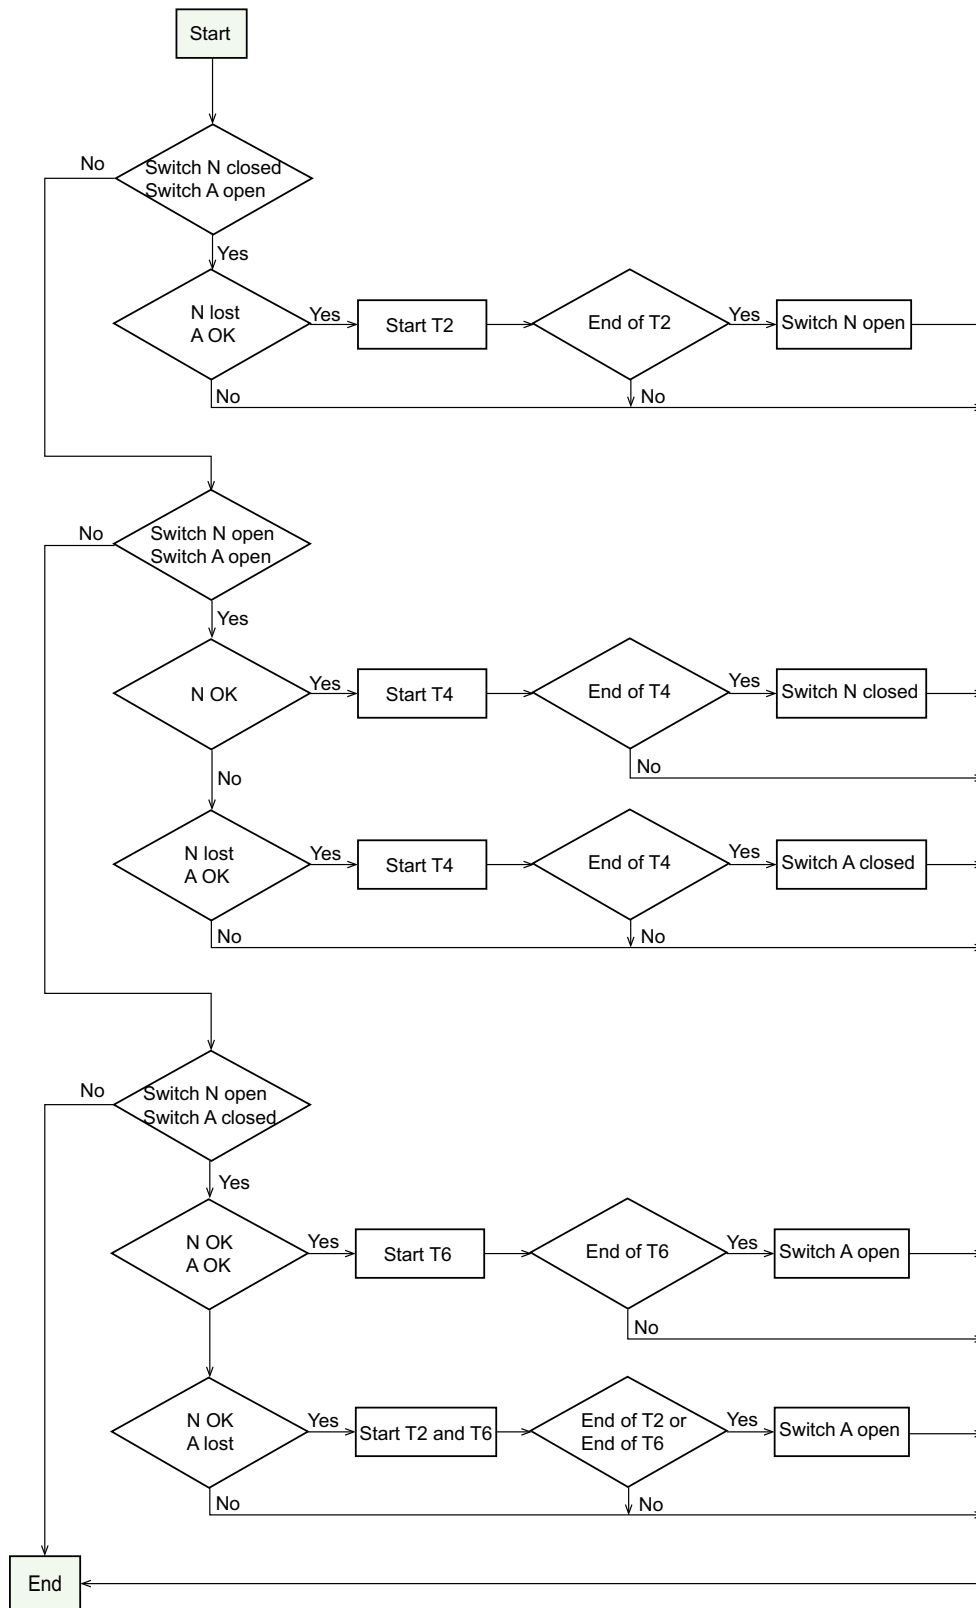

### Transfer Process for Auto-Return U-U Application

- - Power
- - No Power

Transfer Logic for Auto-Return U-G Application

Note: T10 is the Genset fail delay.

# TransferPacT Controllers

## UC Controller

### Non-Return

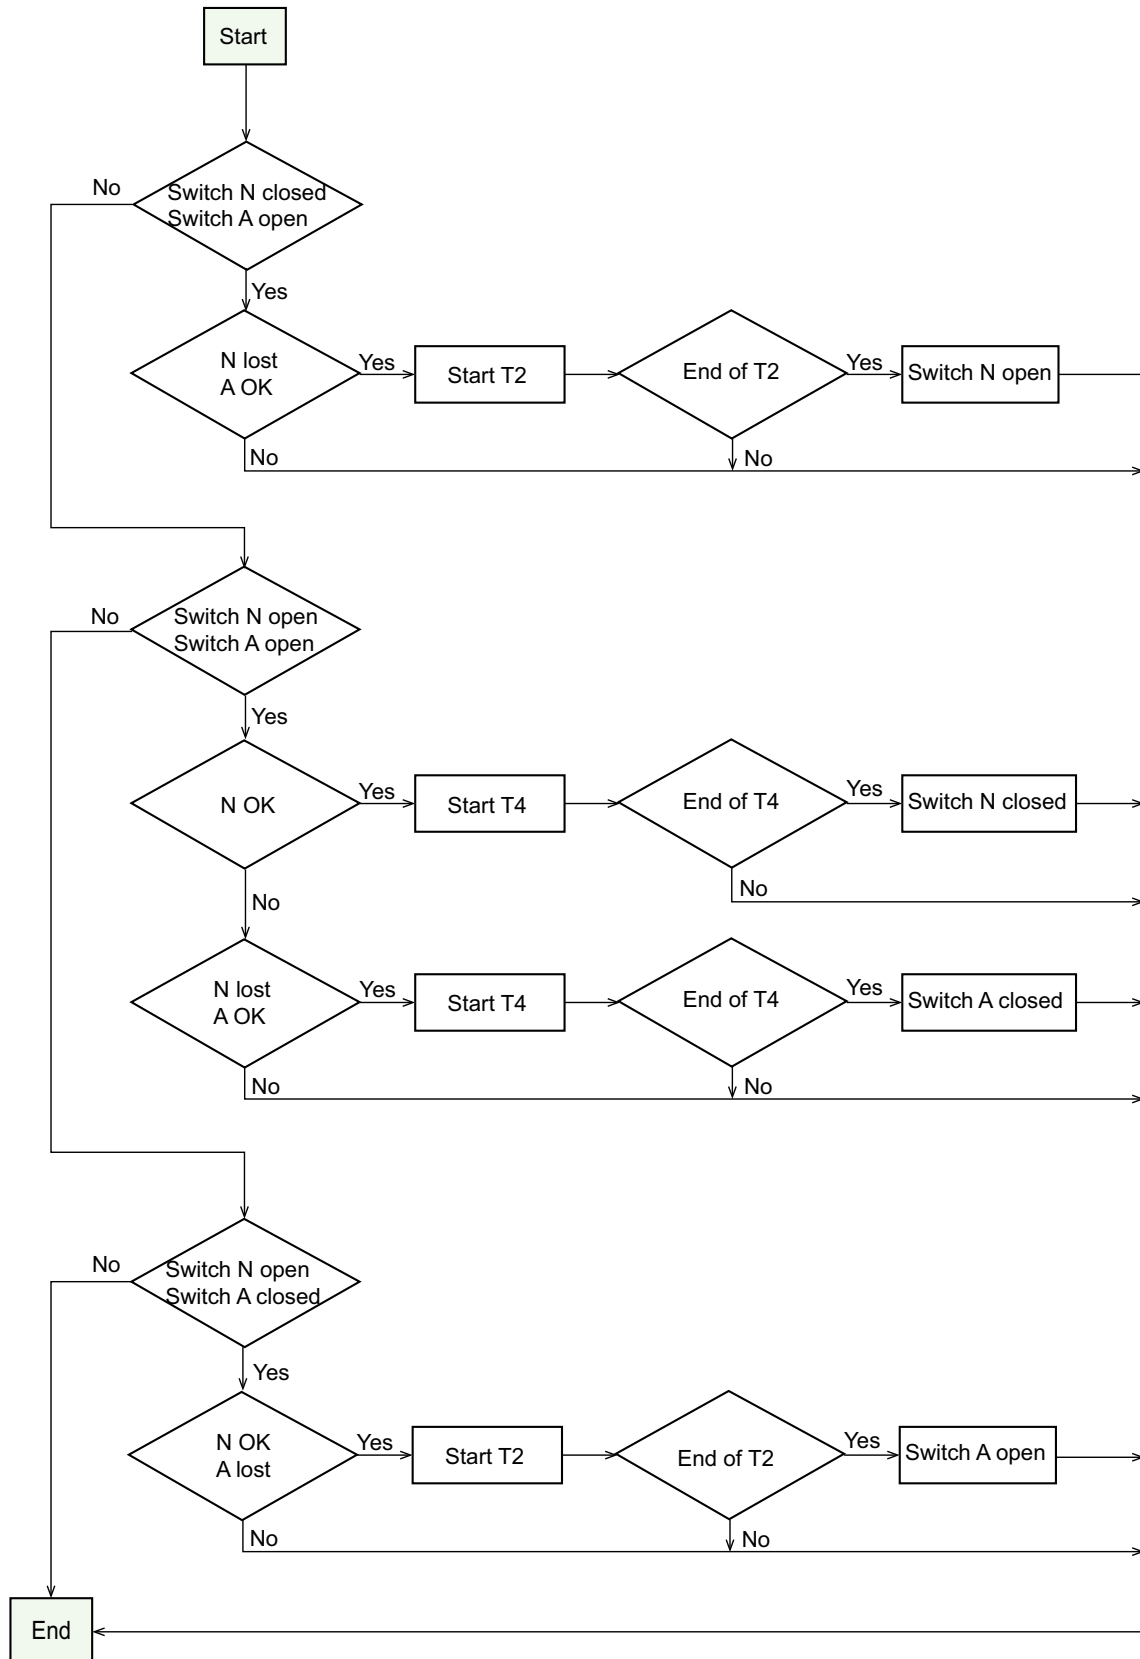

- When the voltage on the N(Normal) source exceeds the threshold (overvoltage, undervoltage, over frequency, or underfrequency) or does not exist, ATSE transfers to the A(Alternate) source.
- ATSE remains on the A(Alternate) source, which exists and within the threshold range (overvoltage, undervoltage, over frequency, or underfrequency). When the voltage on the A(Alternate) source exceeds the threshold range and the voltage on the N(Normal) source is within the threshold range, ATSE transfers to the N(Normal) source.
- The Auto-Non return has the same transfer sequence with self-return in terms of Auto-transfer.

Transfer Logic for Non-Return U-G Application

Note: T10 is the Genset fail delay.

# TransferPacT Controllers

## UC Controller

### Manual-Return

- When the voltage on the N(Normal) source exceeds the threshold (overvoltage, undervoltage, over frequency, or underfrequency) or does not exist, ATSE will be transferred to the A(Alternate) source.
- ATSE remains on the A(Alternate) source, which exists and within the threshold range (overvoltage, undervoltage, over frequency, or underfrequency). When the voltage on the A(Alternate) source exceeds the threshold range and the voltage on the N(Normal) source is within the threshold range, ATSE remains on the A(Alternate) source until manual recovery.

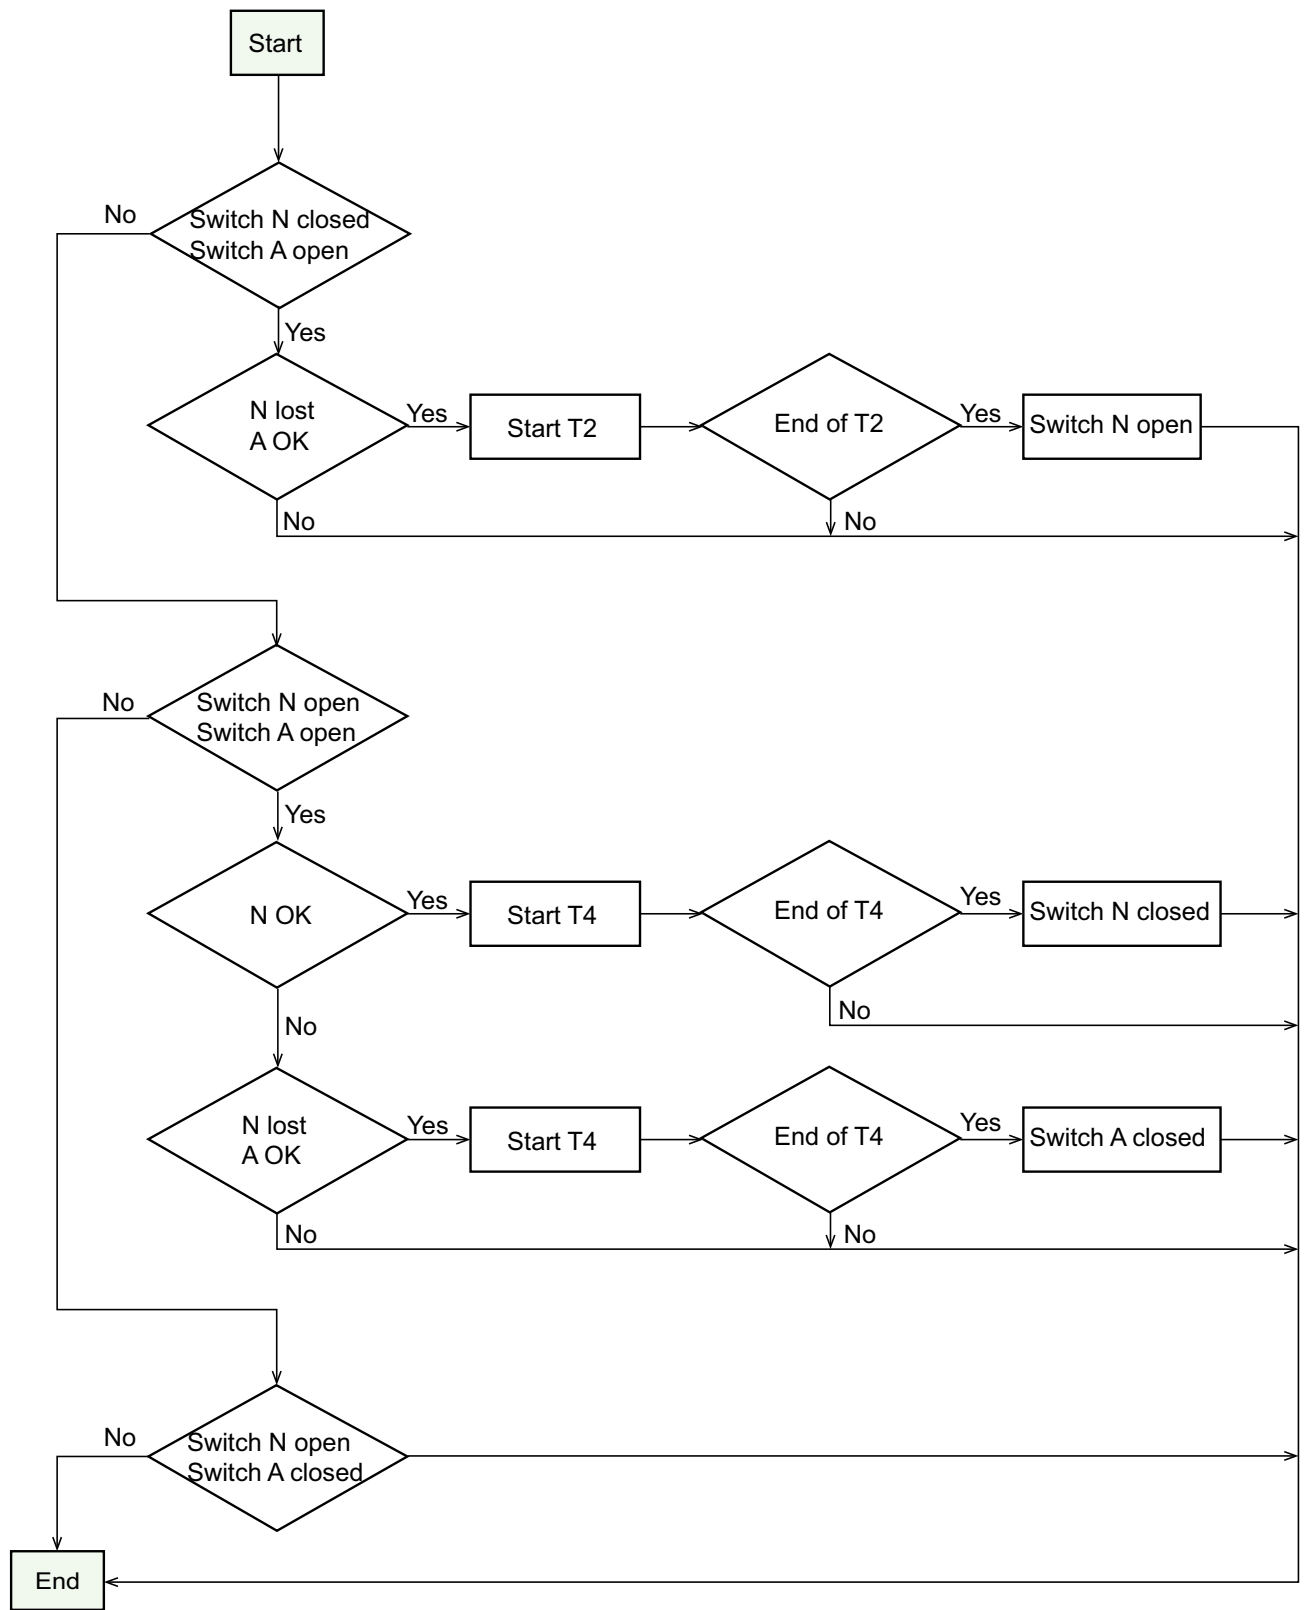

**Note:**The transfer switch cannot return automatically until manually operating.

### Transfer Process for Manual-Return U-U Application

# TransferPacT Controllers

## UC Controller

### Communication Control Mode

The communication control function allows TSE to transfer or test through communication.

The communication control function can be enabled/disabled through TransferPacT UC HMI.

To use the communication control successfully, at least one communication module must be installed and activated.

**NOTE:** Communication control is OFF by default. Follow the instructions below to enable communication control.

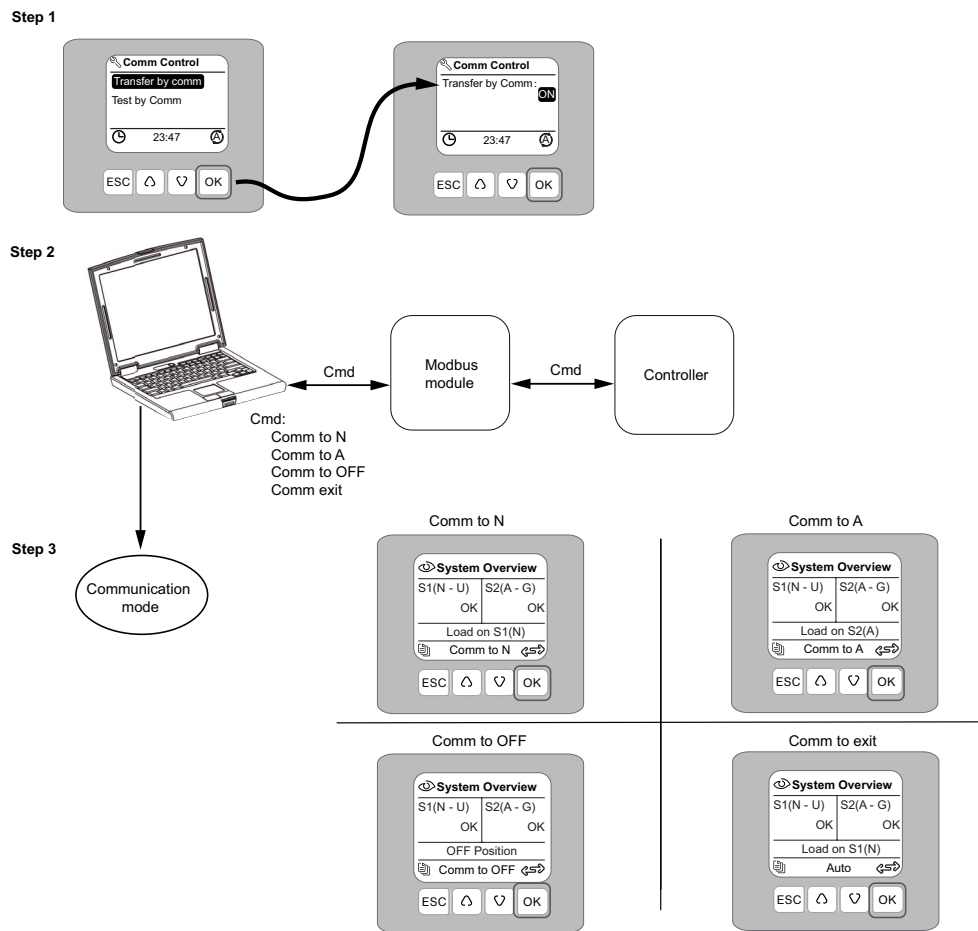

### Transfer by Communication

#### Transfer Logic Overview

Transfer by communication supports the following four commands:

- Comm to Normal Source
- Comm to Alternate Source
- Comm to OFF
- Comm Exit

The command is sent through PC - Modbus. Comm to Normal/Alternate source is equivalent to the voluntary transfer mode behavior. Comm to OFF is equivalent to local control to Off, but not equivalent to force to Off. The ATSE transfers to OFF after receiving the command without any time delay.

## Exit Communication Control Mode

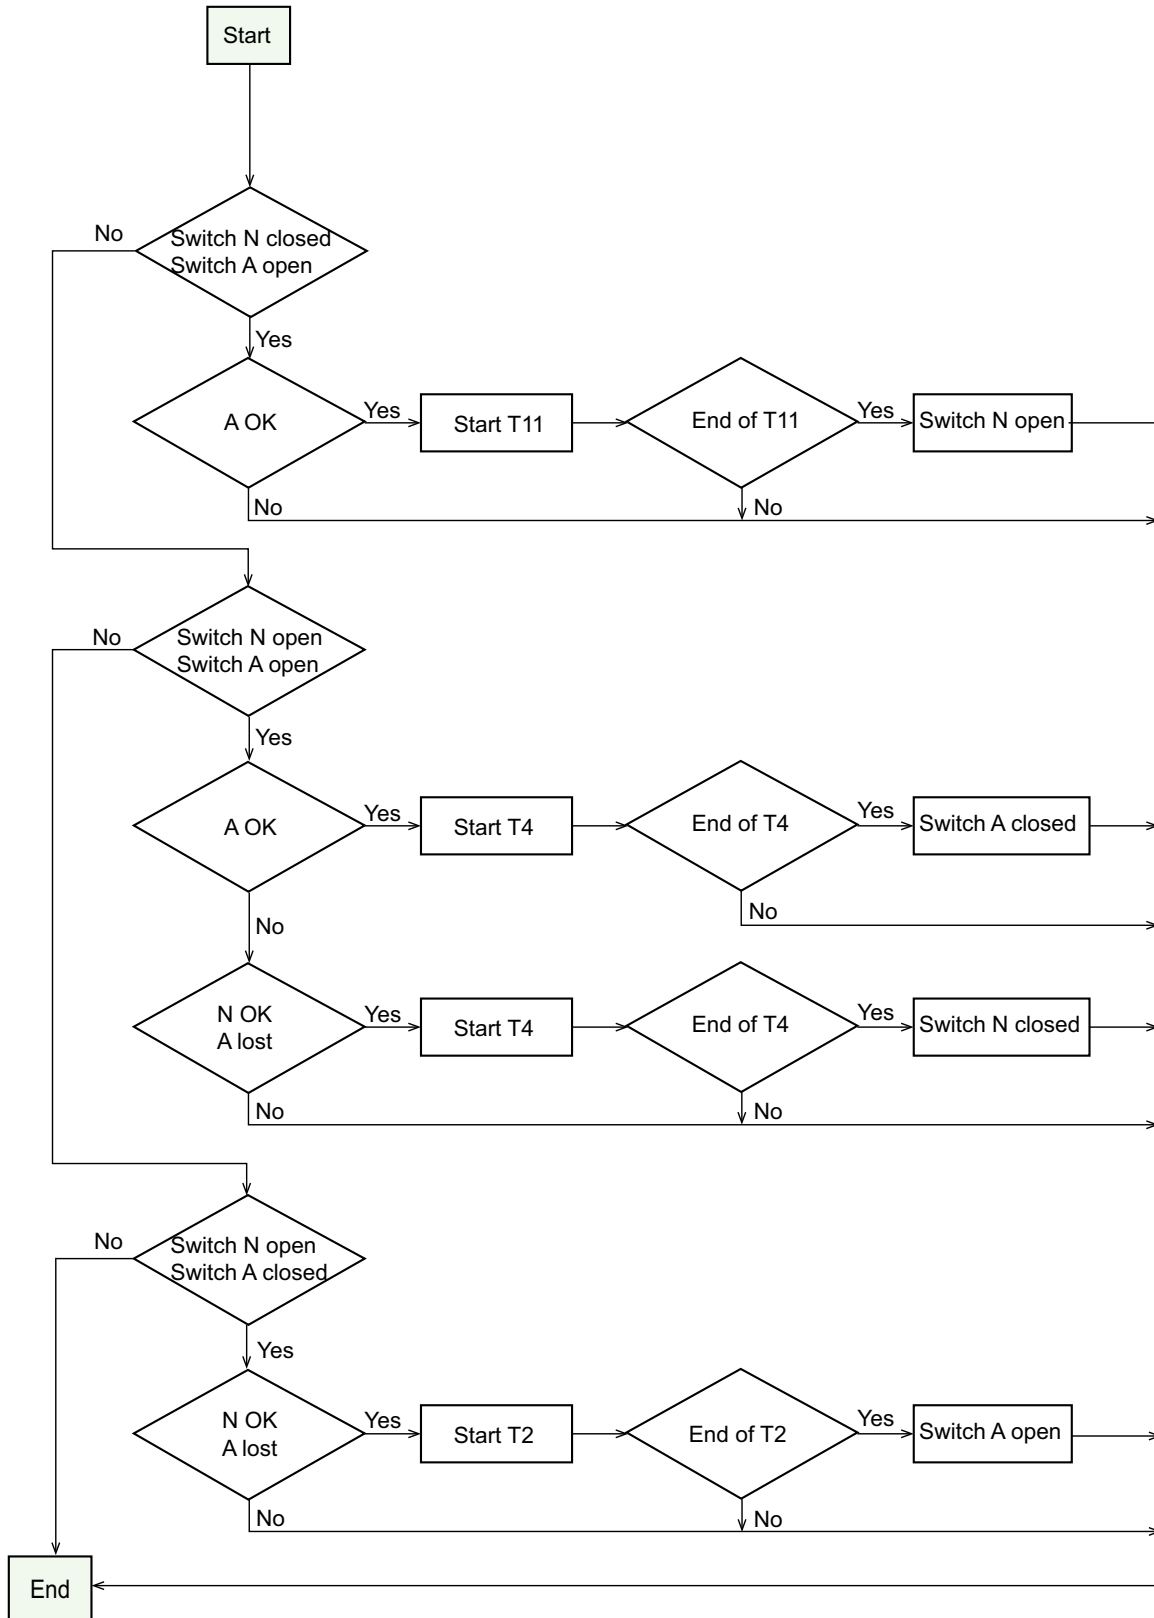

There are three ways to exit communication control mode:

- The Modbus server device sends the exit command to the active Modbus module installed on ATSE.
- Turn off Transfer by Comm from TransferPacT UC.
- The active Modbus module is offline.

# TransferPacT Controllers

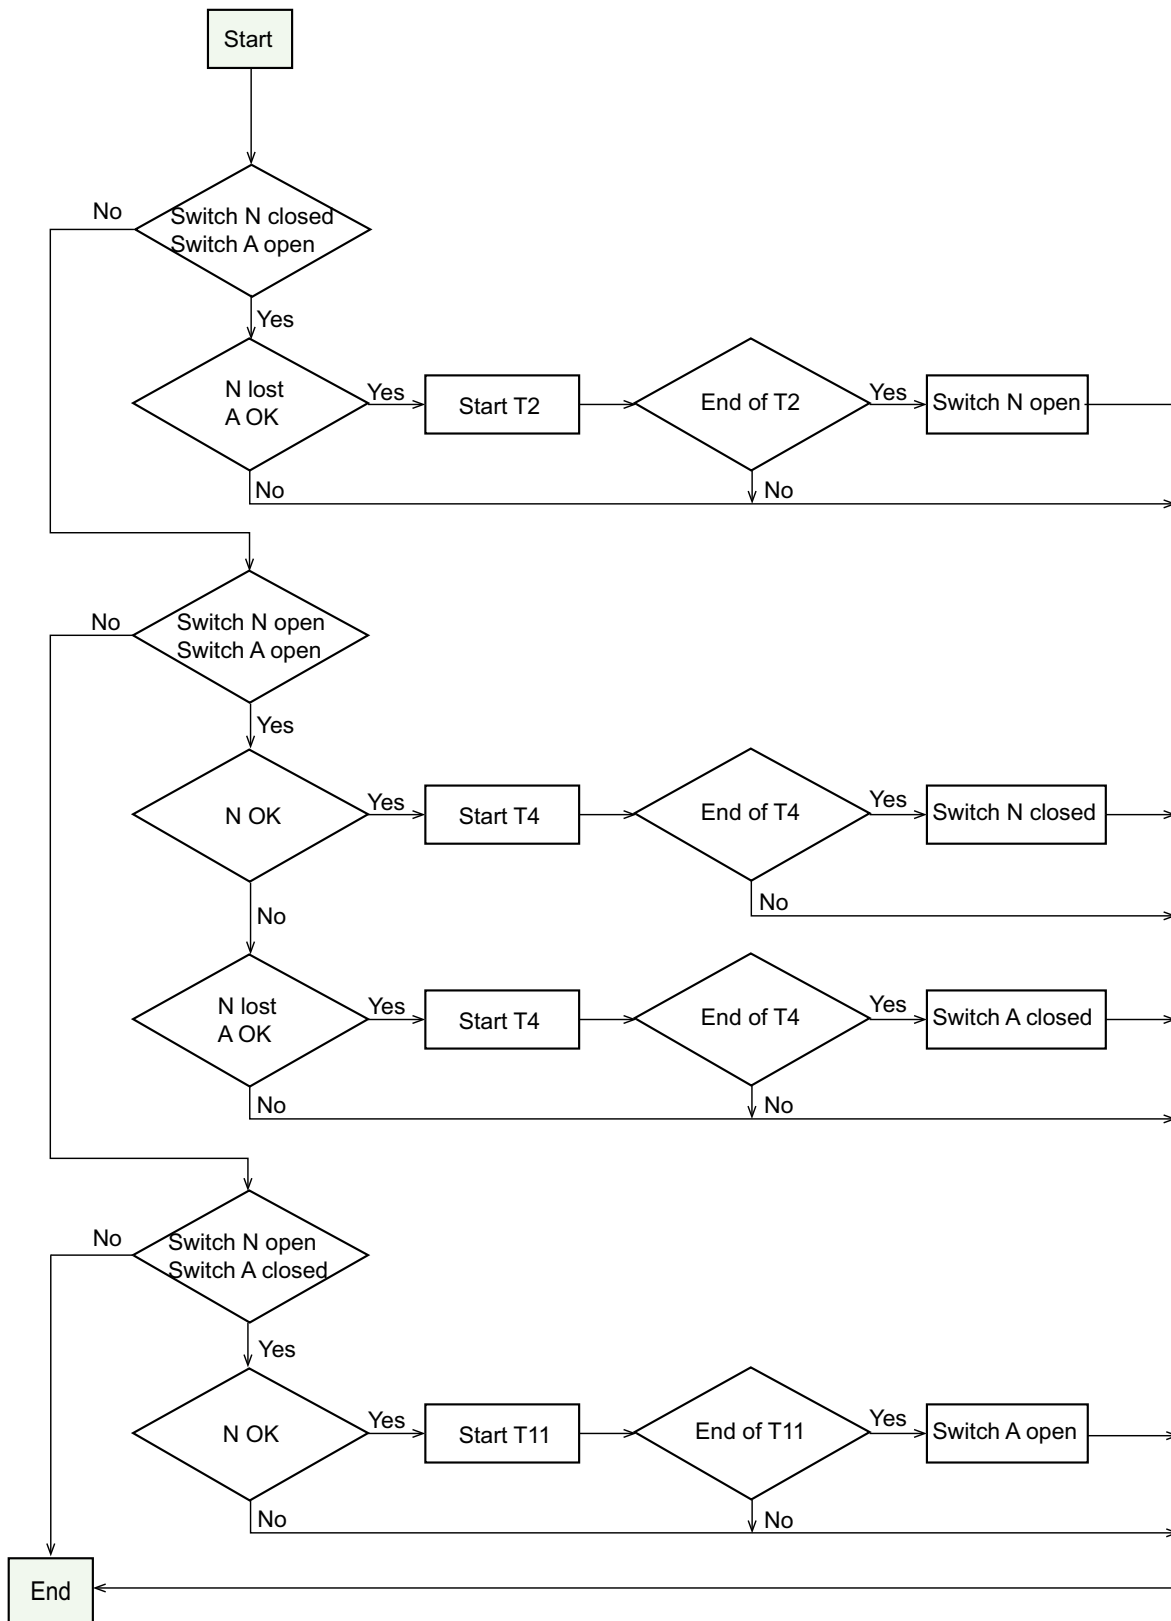

## UC Controller

### Transfer Logic of Communication to A (U-U Application)

Note: T11 is internal fixed time delay.

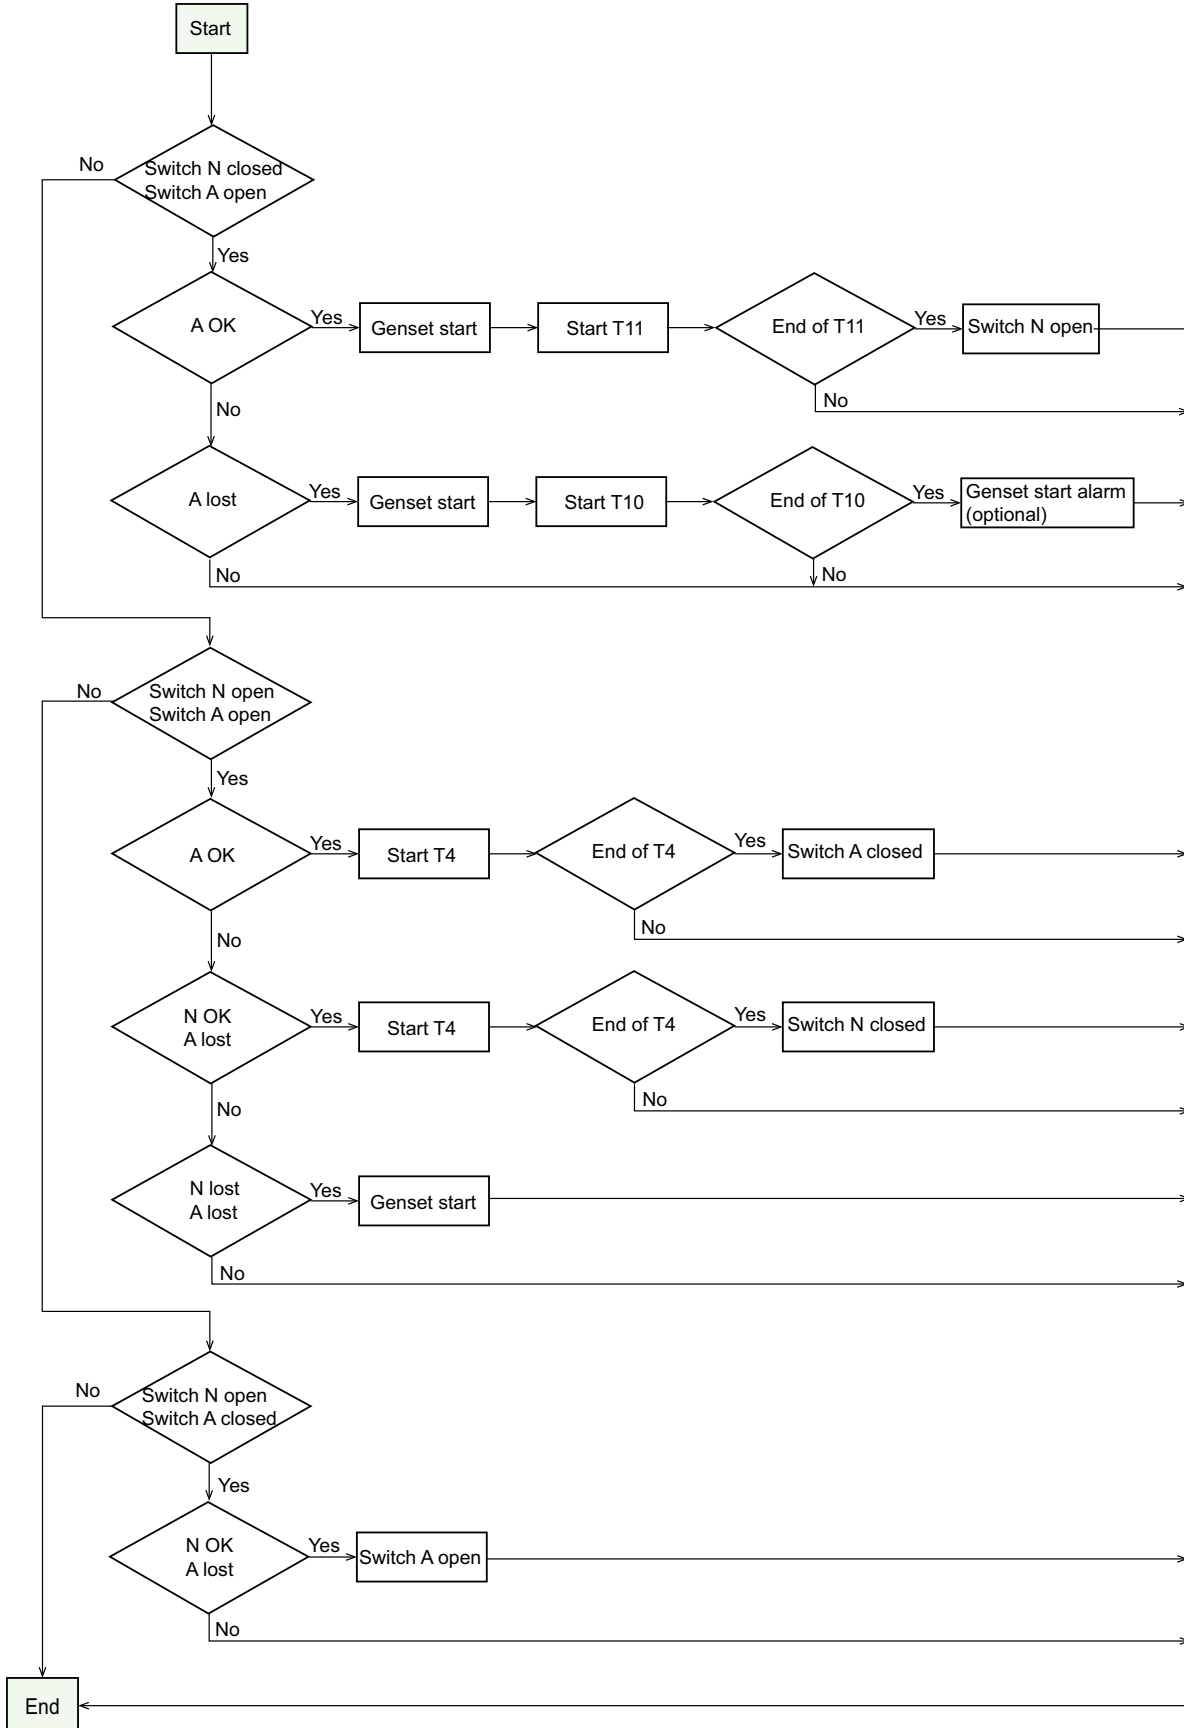

Transfer Logic of Communication to N (U-U Application)

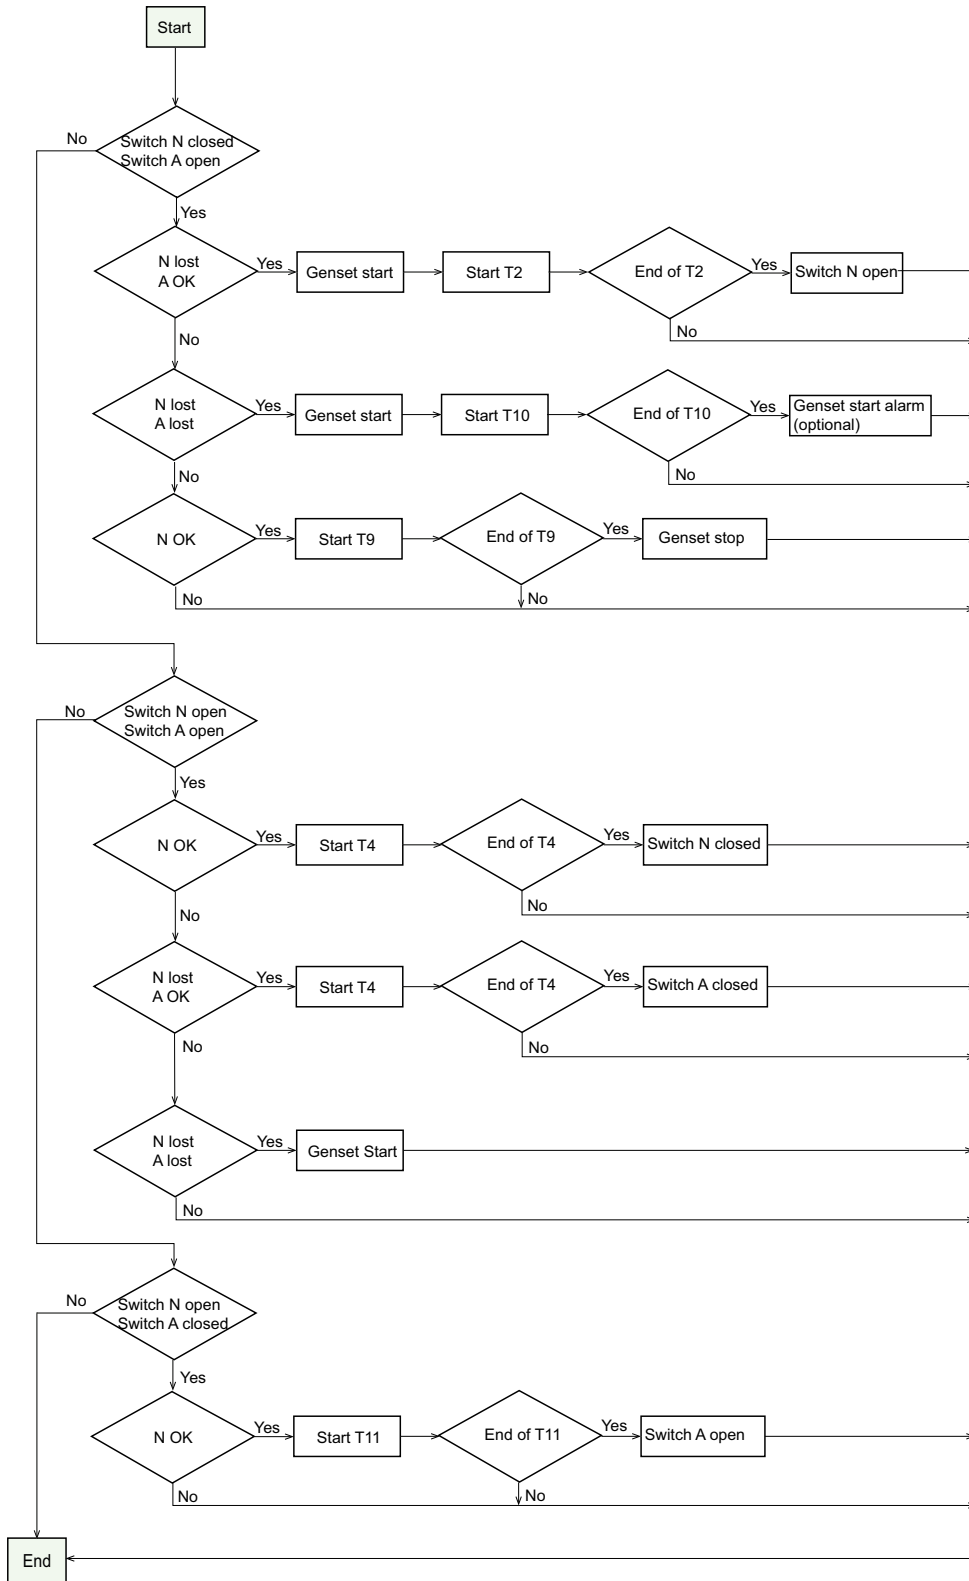

# TransferPacT Controllers

## UC Controller

### Transfer Logic of Communication to A (U-G Application)

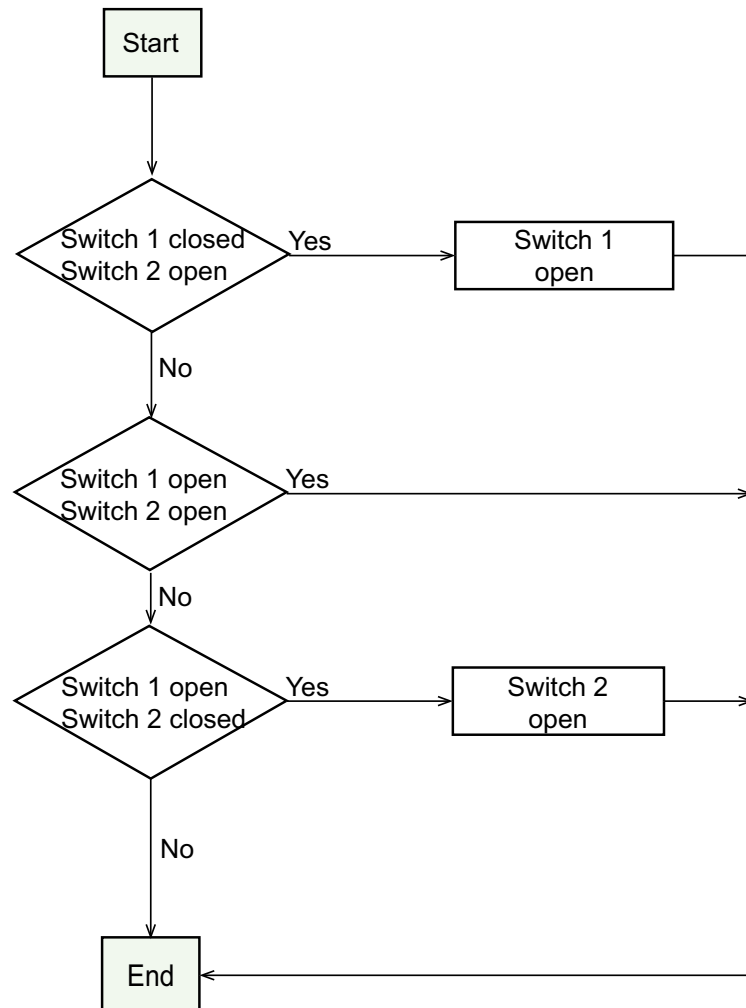

Transfer Logic of Communication to N (U-G Application)

## Transfer Logic of Communication to Off

Comm to OFF is equivalent to local control to off in Local Control Mode. The ATSE transfers to OFF after receiving the command without any time delay.

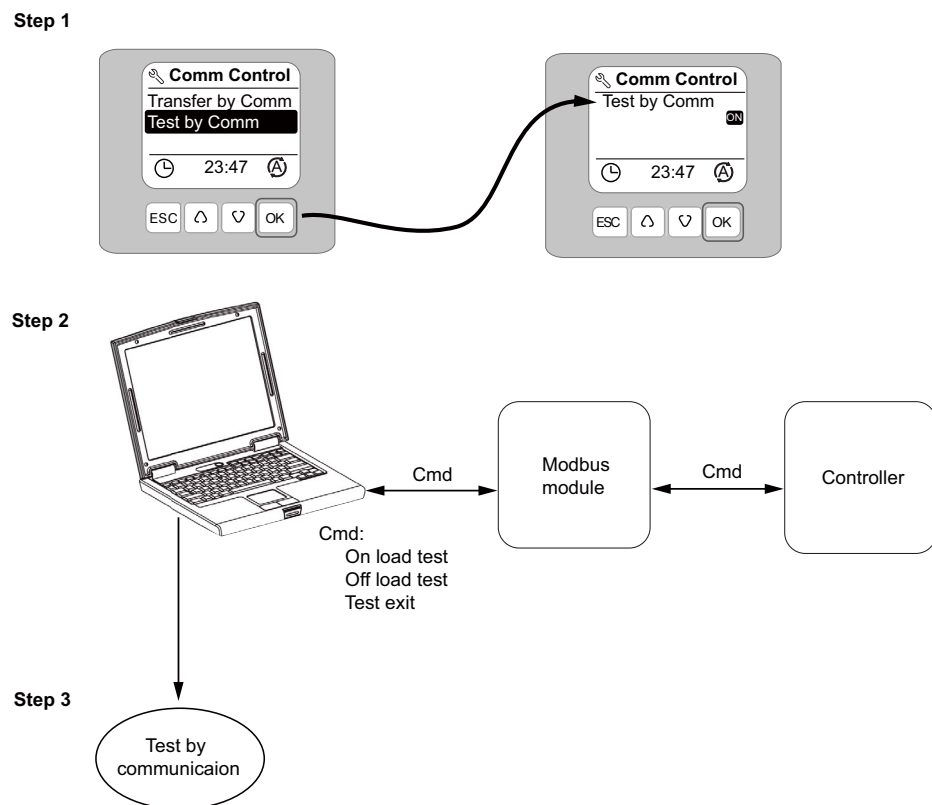

### Test by Communication

Test through communication supports the following three commands:

- On Load Test
- Off Load Test
- Test Exit

When the test is ongoing, ATSE ignores any other interface signal from active automatic HMI or DI(Digital Input) module (TPCDIO07).

The operation of test by communication is equivalent to test mode.

### Stop Test by Communication

There are two ways to exit communication control mode:

- The Modbus server device send Test Exit command to the active Modbus module installed on ATSE.
- Turn off Transfer by Comm from TransferPacT UC.

# TransferPacT Controllers

## UC Controller

### Voluntary Transfer Mode

The voluntary transfer mode is equivalent to auto mode, with forced priority to the SI or SII source. It is activated when associated input is closed (the commercial reference number for the voluntary control module is TPCDIO08). It takes over 200 ms to activate the voluntary mode. The signal for voluntary transfer must be maintained.

Voluntary transfer is normally used for special tariffs or anticipated events. Once the mode is set from voluntary to N or A, ATSE still remains in auto mode, only the source priority is modified. When there is power loss or deviation on the priority source, transfer switch can re-transfer to available source automatically.

The following are examples of voluntary transfer mode use cases:

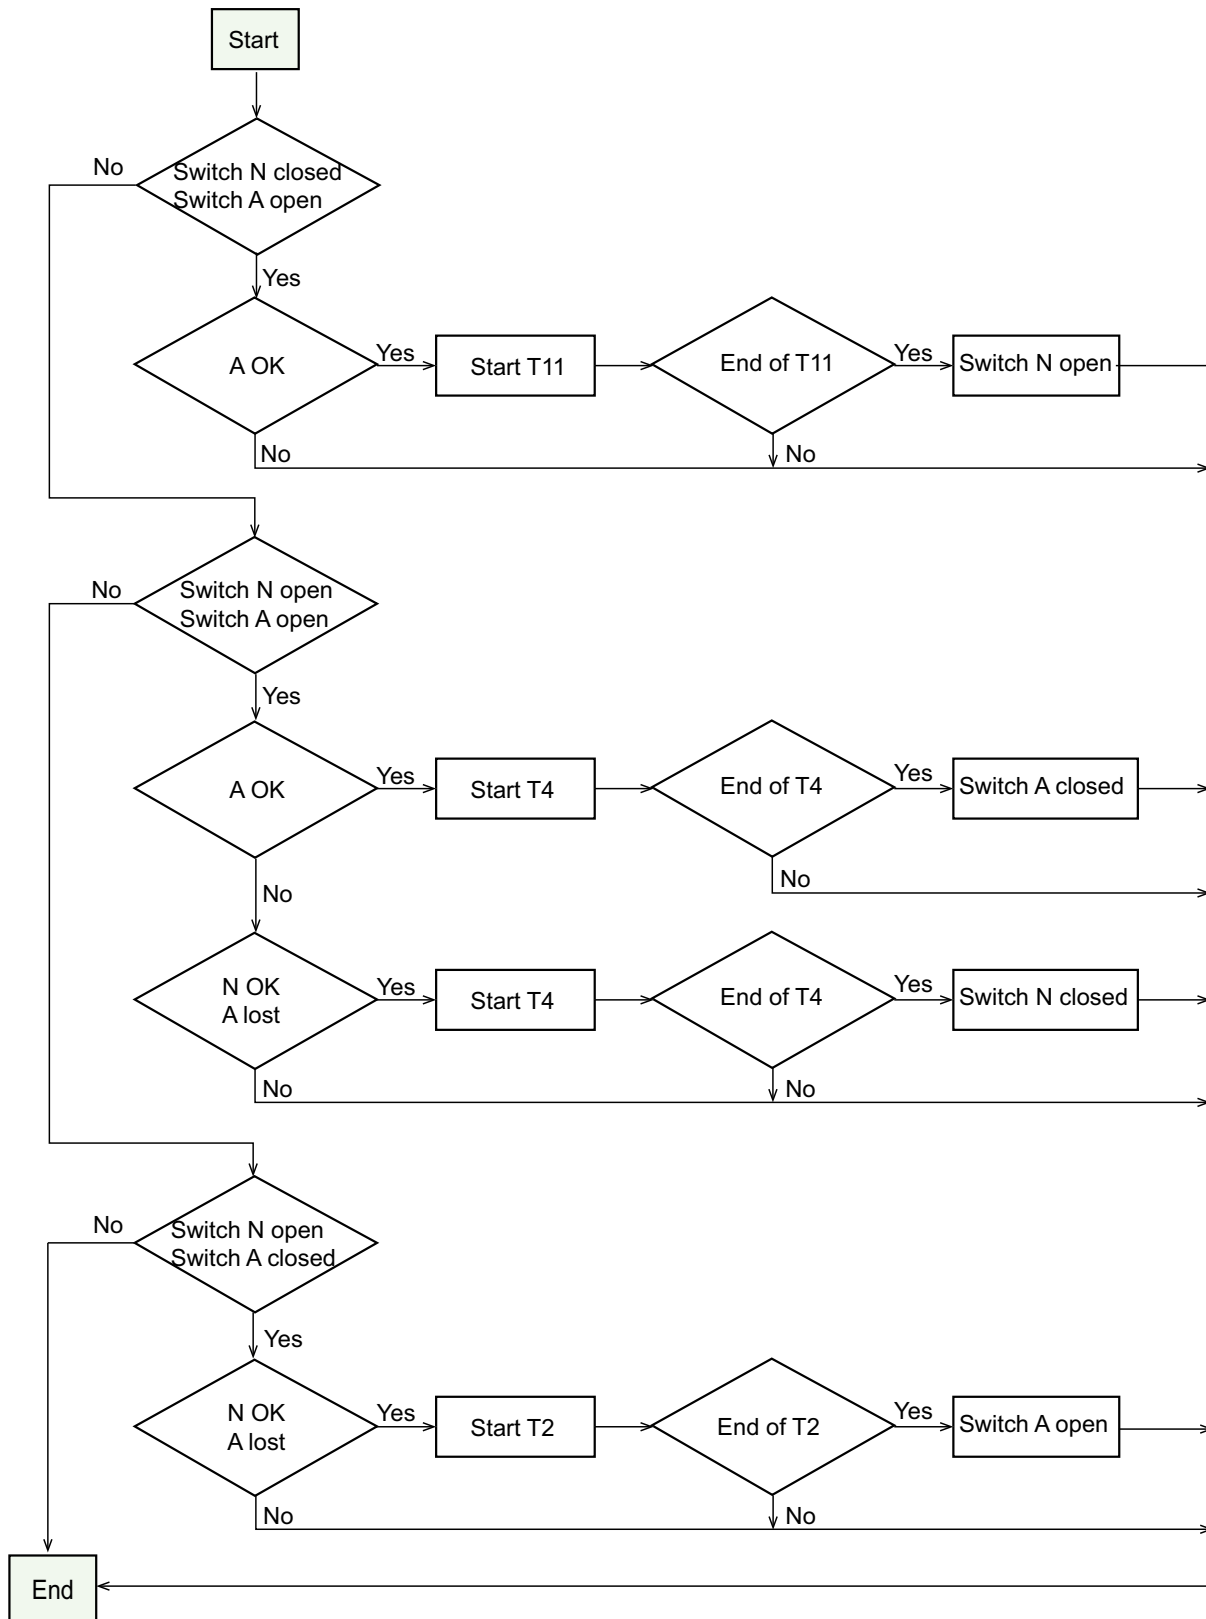

#### Use Case 1: Weather Event Mode

During typhoon or earthquake, the genset is more stable than utility. The user for this case has installed a weather event mode switch on his/her control panel. The user activates the weather event mode switch. It is connected to the voluntary transfer mode input which transfers to alternate source. The ATSE activates the genset output and transfers to genset once ready. If genset fails, the ATSE still being in auto mode, it tries to retransfer to normal source. The ATSE continues in auto mode. It detects alternate source failure. The configuration needed is a ATSE along with voluntary transfer module.

#### Use Case 2: Peak Shaving Tariff (Align with Controller UC)

This feature is designed for utility peak shaving (special tariff). The user might want to disconnect from the network when energy price are high. Usually utility provides a signal that can be directly connected to the voluntary transfer input. In this case the ATS automatically transfer to alternate source when the signal is present. This process helps shedding the peaks on the network.

Transfer Logic of Auto-voluntary to A (U-U Application)

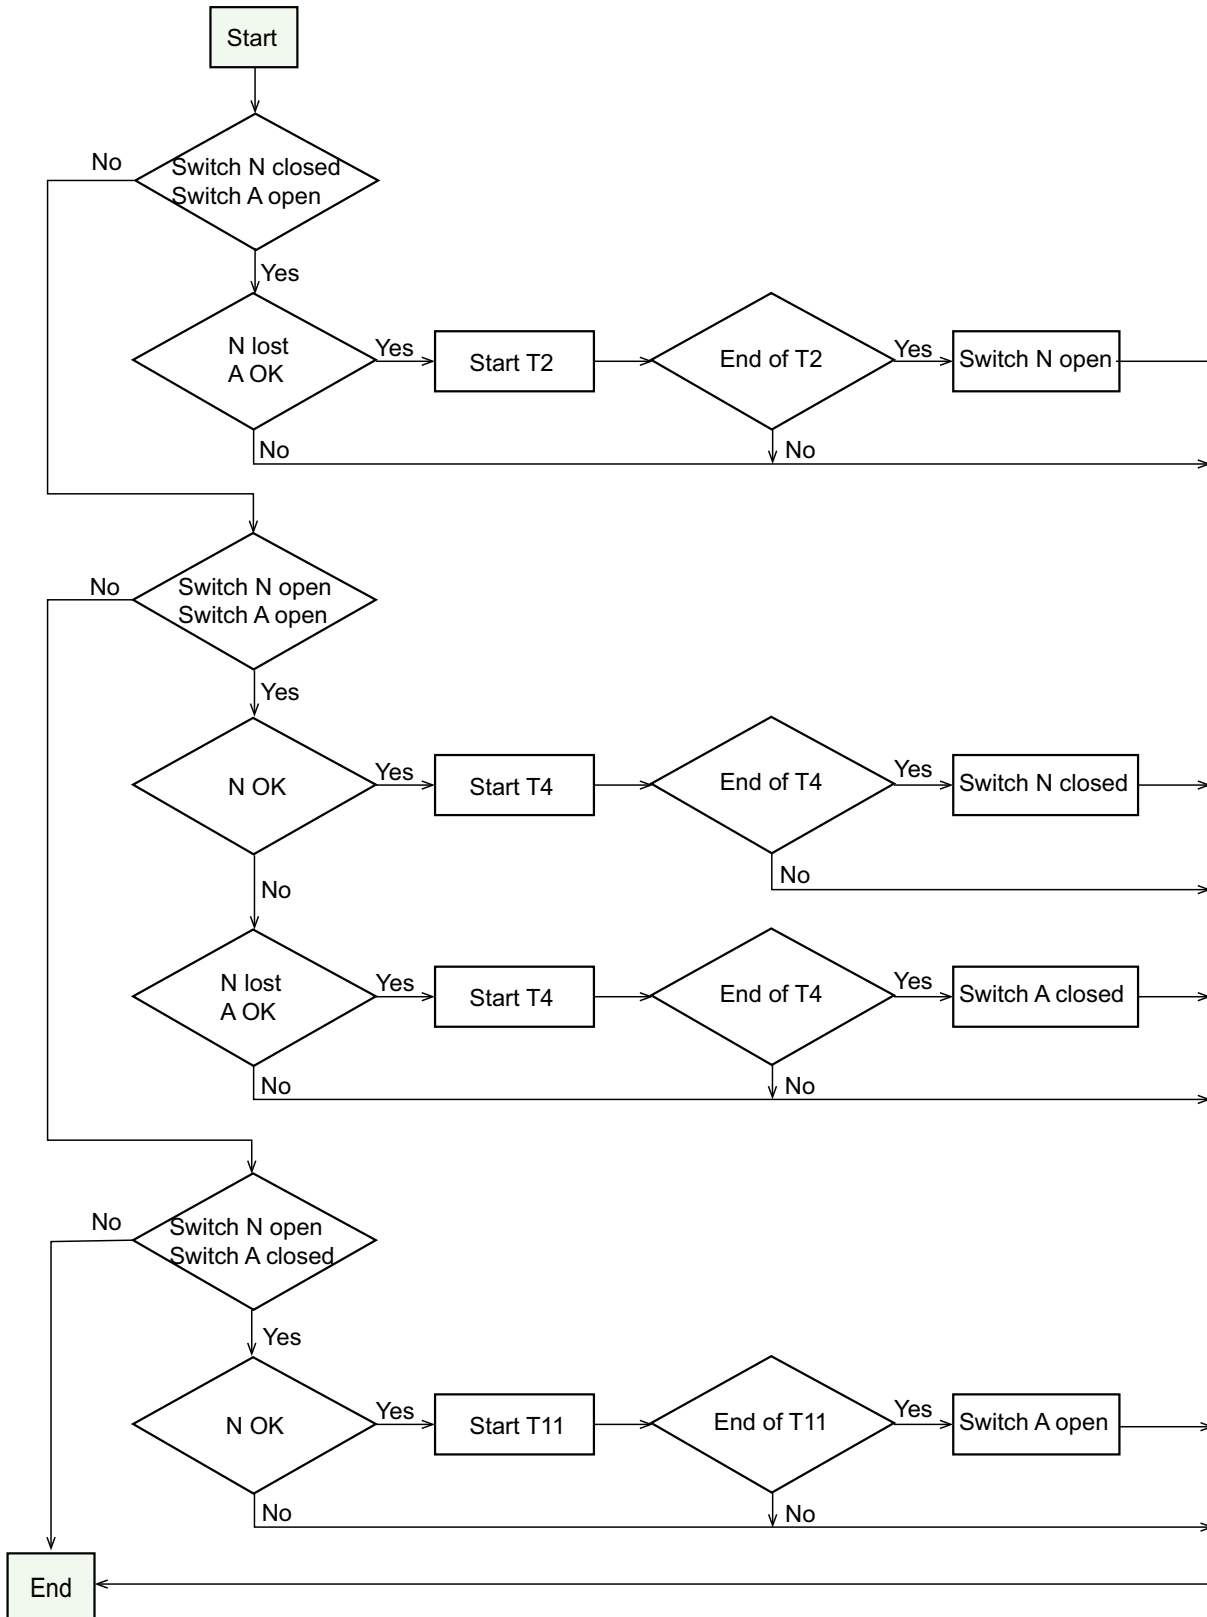

NOTE: T11 is internal fixed time delay

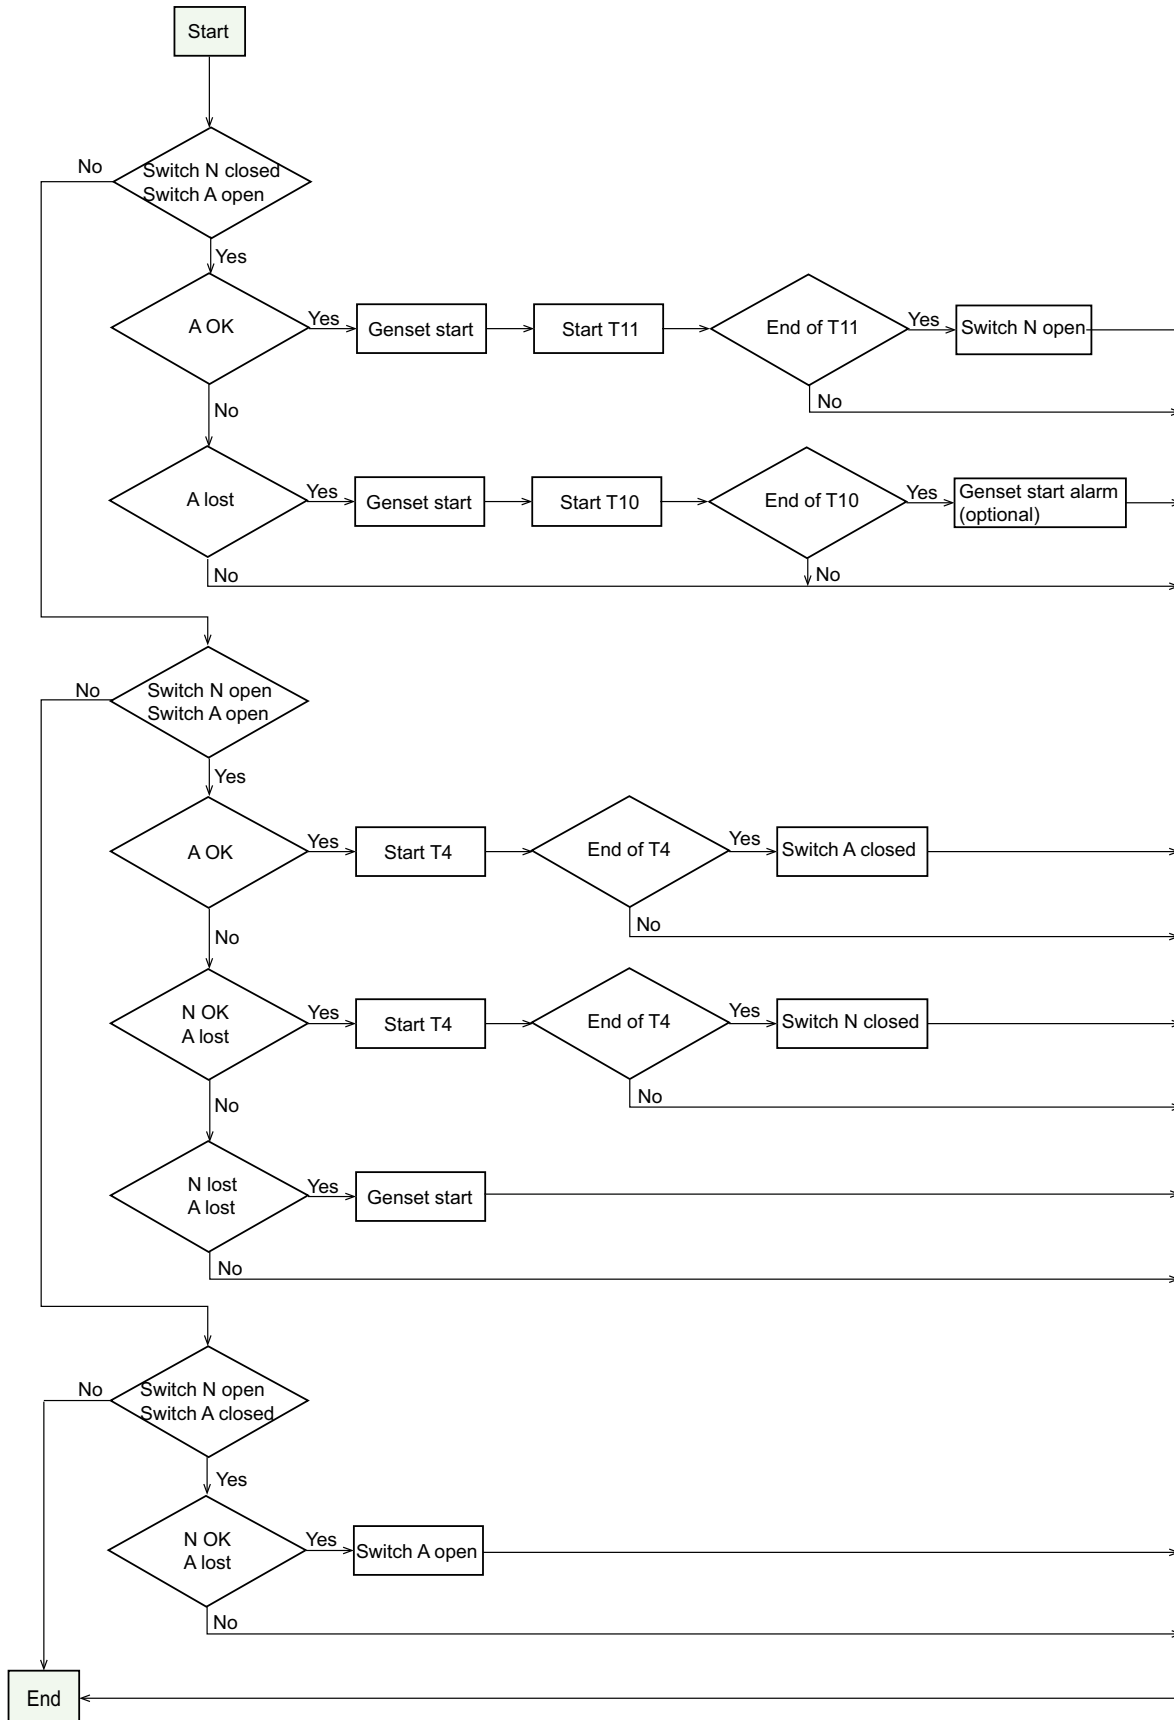

# TransferPacT Controllers

## UC Controller

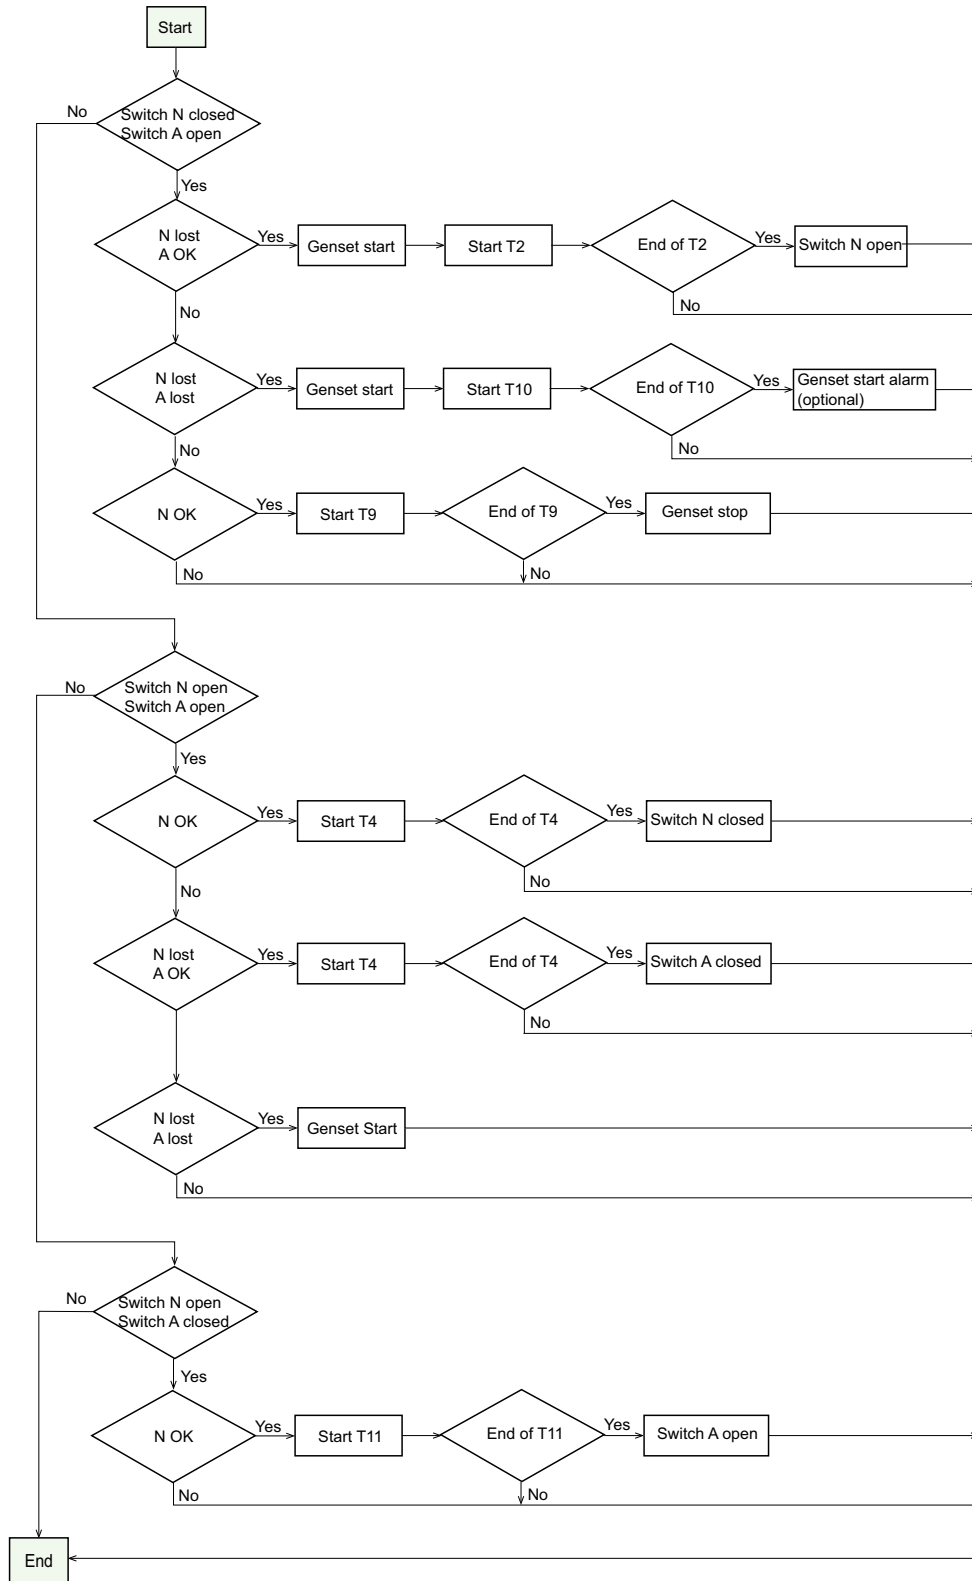

### Transfer Logic of Auto-voluntary to N (U-U Application)

Transfer Logic of Auto-voluntary to A (U-G Application)

Transfer Logic of Auto-voluntary to N (U-G Application)

## Test Mode

The test mode is a procedure to simulate the transfer process with following purpose:

- Test normal transfer actions for ATSE-On load test
- Test Genset-Off load test
- Test Genset-Transfer functions-On load test

### Ways to Start Test

There are three ways to conduct the test:

- Through TransferPacT UC HMI.
- Through DI using TPCDIO07 accessories.
- Through Modbus communication using TPCCOM76 module.

There is no priority among the test command from HMI, DI(Digital Input), and Modbus. ATSE acts upon receiving the command from any way.

Command to exit test should be sent through the same way used to start the test. Otherwise ATSE does not respond. For example, if you start the test through DI(Digital Input) module, you have to stop the test through DI(Digital Input) module as well.

### Default Time for Test

- Default as unlimited test (no time duration, tests required to be stopped manually).
- If you select limited test, the default time duration is 30 s.

### Time Range for Test

- 1 s–1800 s with steps of 1 s.
- Press ESC key in Active Automatic HMI to avoid time delay.

### Pre-Condition to Start Test Mode

The following conditions are mandatory for the test:

- ATSE is in auto mode.
- ATSE is in normal position while in U to U application.
- ATSE is in alternate position while in U to U application.
- ATSE is in normal position while in U to G application.
- For U-U application, A source shall be available before test. Otherwise, there is a warning.

### Genset Off Load Test

- The purpose of this function is to check if the GenSet can start, without power interruption.

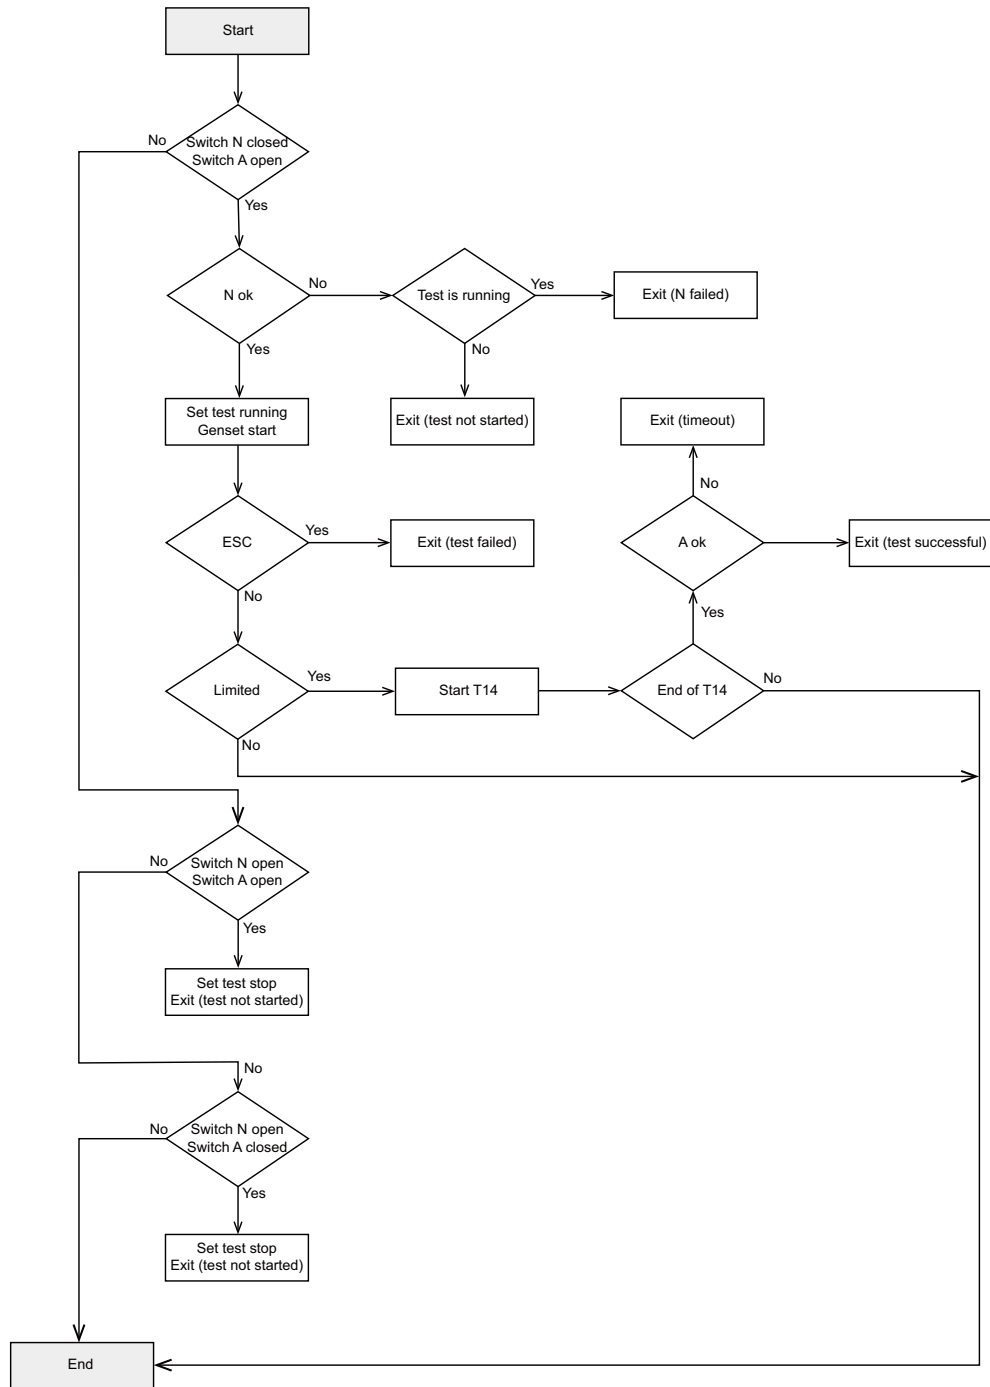

#### NOTE:

- This test does not check if the switch is able to make the transfer.
- The test is only available with U-G configuration.
- The off load test is not available, when the ATSE does n't have genset output feature.
- The orders with higher priority interrupt the test procedure.
- The off load test does not energize transfer process.

# TransferPacT Controllers

## UC Controller

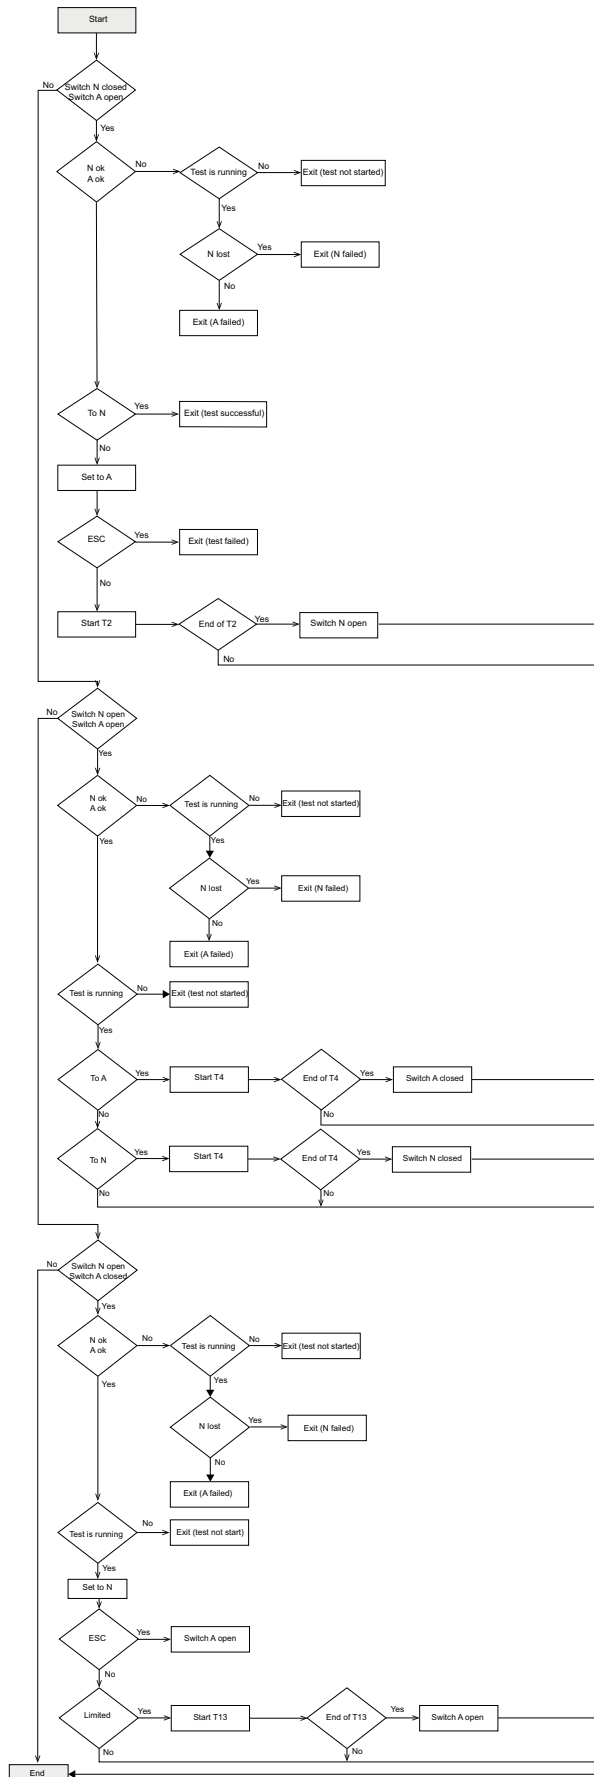

### Logic of Genset off Load Test U-U

#### On Load Test

- This function is accessible for product with HMI, as the Test mode default value is On load.
- The orders with higher priority interrupt the test procedure.
- The on load test energizes transfer process.

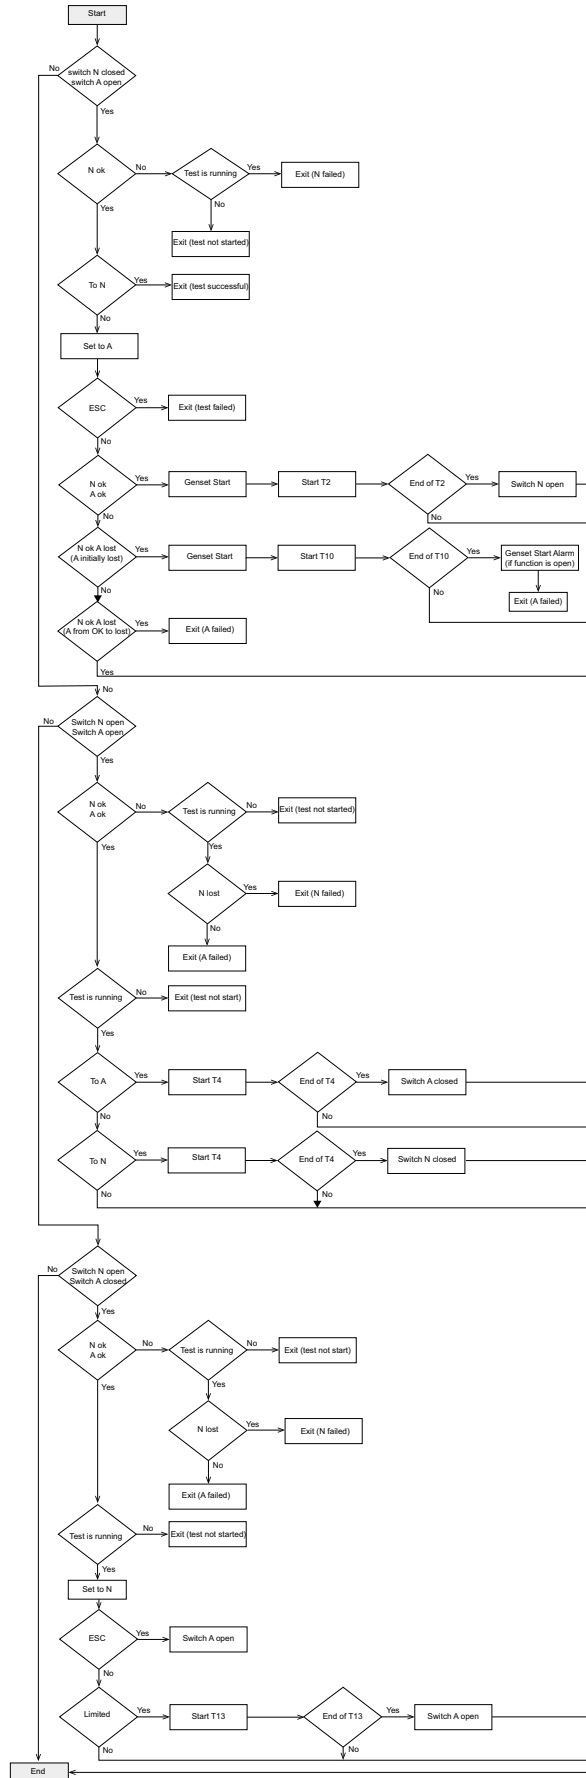

Logic of on Load Test U-U

# TransferPacT Controllers

## UC Controller

### Logic of on Load Test U-G

## Local Control Mode

**⚠ CAUTION****HAZARD OF EQUIPMENT DAMAGE**

Enable the manual control through pressing Local mode button to exit the auto mode.

**If not avoided, could result in minor or moderate injury.**

**NOTICE****POTENTIAL POWER OUTAGE OF EQUIPMENT**

To re-enter Auto mode, disable local control through pressing Local mode button again.

**It is used to address practices not related to physical injury.**

The manual control is activated through pressing Local mode button. It allows locally to change the logical position of the TSE. The switch will refuse to active if the action will damage the driving system. It cannot transfer to unavailable source.

**NOTE:** Manual transfer is not active, if transfer action damage driving system (for example, both overvoltage are out of range, TSE refuses to transfer) or both sources are out of operating voltage of auxiliaries. Auto Genset start signal and load shedding signal are not available for this mode. In this case, the target source conformity is verified before transfer and time delays are not considered.

**NOTE:** Manual operation by cuicuit breaker requires attention to the following information:

- If manual operation of the circuit breaker is required, the controller needs to be switched to local mode through the local control button.
- No operation for load shedding and generator, keep the status as before.
- No alarm relay output.

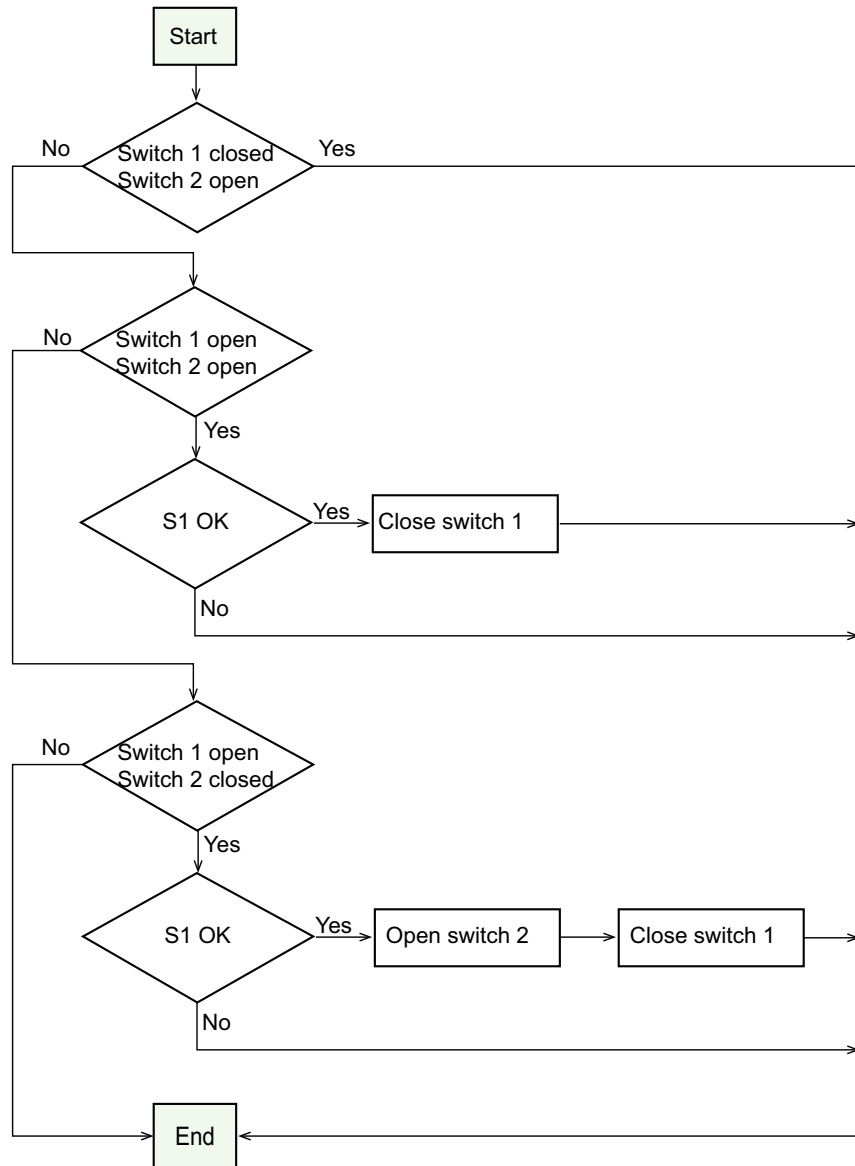

# TransferPacT Controllers

## UC Controller

Local Control to S1

The command is sent through pressing the Button I. The switch transfers to normal after button press if normal voltage is within operating range.

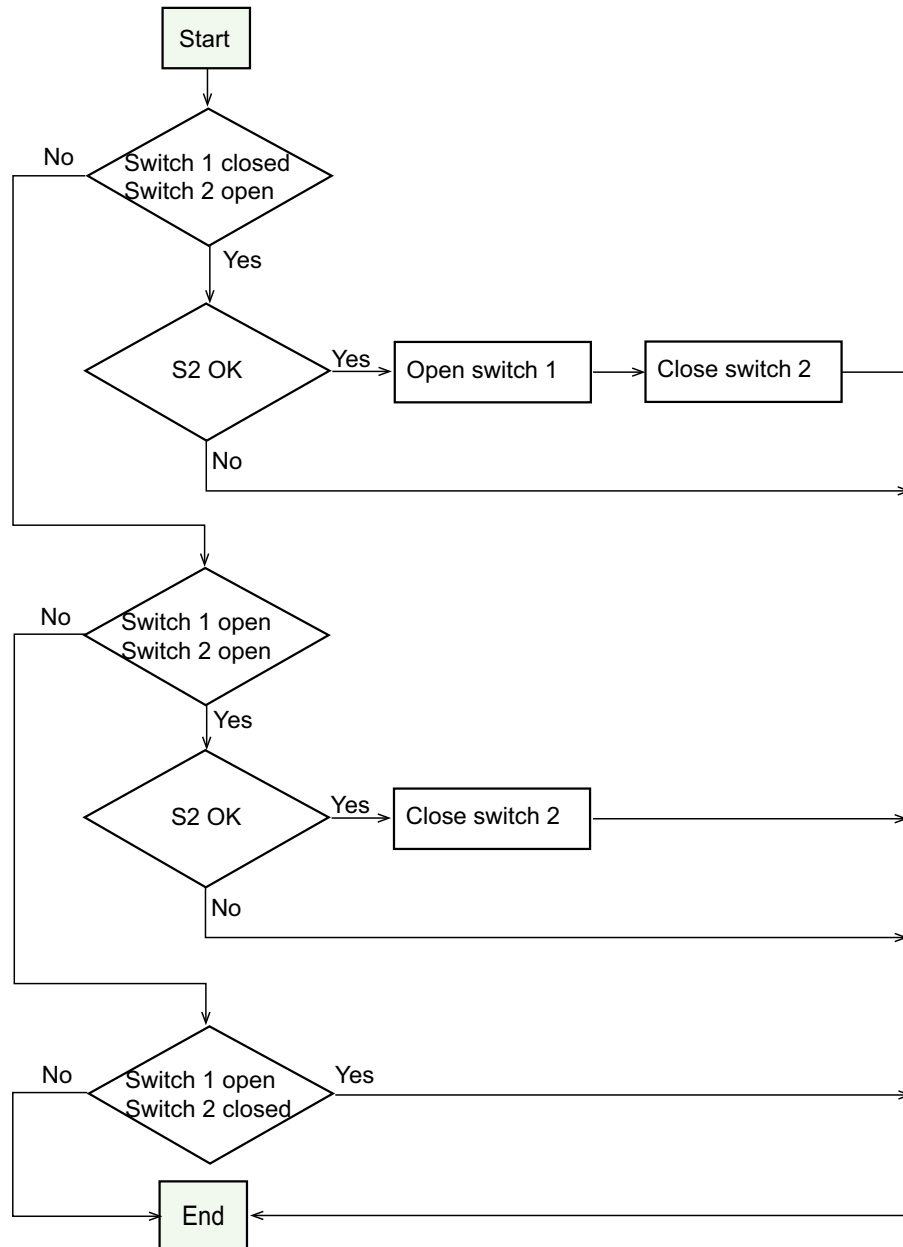

# TransferPacT Controllers

## UC Controller

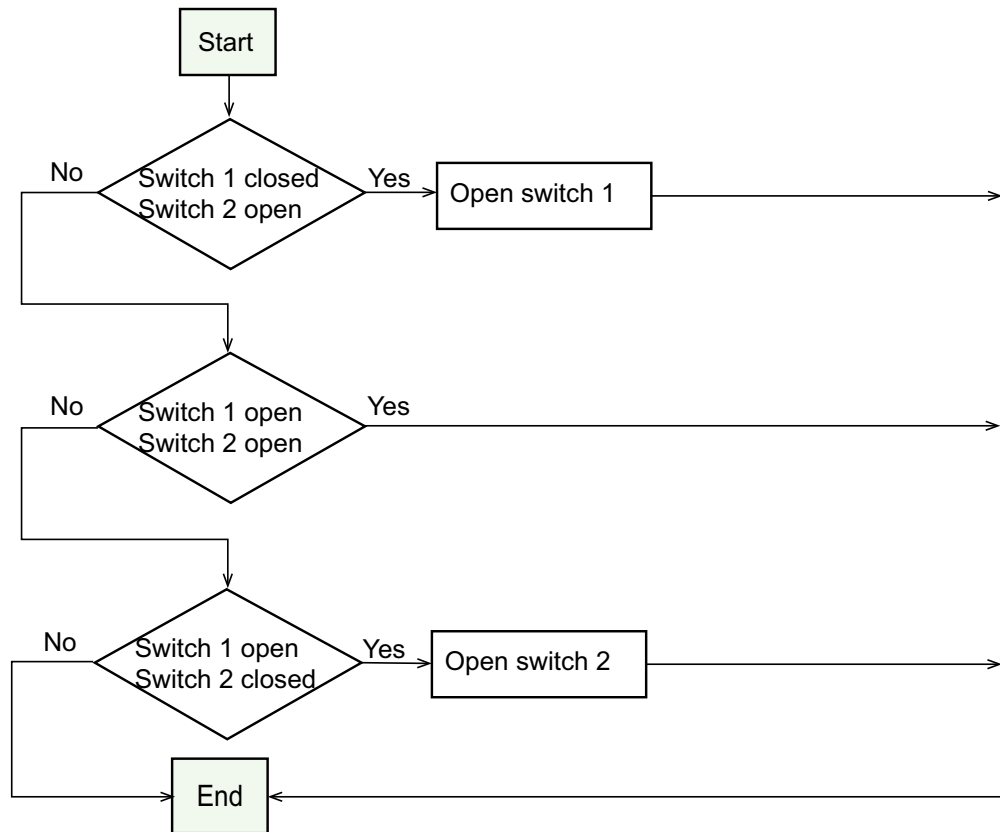

### Local Control to S2

The command is sent through pressing the Button II. There is no time delay. The switch transfers to normal after button press if normal voltage is within operating range.

Local Control to O

The command is send through pressing the Button O. There is no time delay. The switch transfers to OFF after receiving the order.

# TransferPacT Controllers

## UC Controller

### Transfer Inhibit Mode

When the transfer inhibit input is active, the controller can not send any order to TSE. Front face manual control buttons are locked and the HMI only displays transfer inhibit. Force to OFF still works as before.

Use this mode only when inhibit signal (from DI) is active and no higher operation mode is running. When ATS transfer is ongoing, wait until transfer completed.

The transfer inhibit mode is cancelled when the input signal is released.

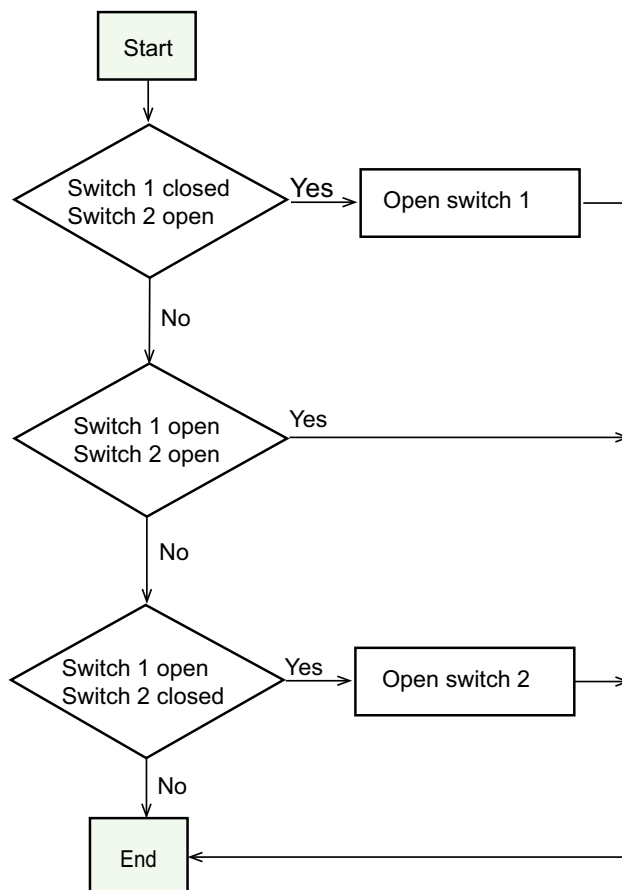

Accessories are required using TPCDIO07 to extend this function of the TSE.

### Application

- Transfer inhibit can be used when there is power interruption because of short circuit.
- This function can be used to lock the controller by custom signals.
- This function can be used for combination of different ATSE.

### Force to Off Mode

- In this mode, ATSE transfers to OFF position upon an emergency stop order. Other transfer modes will be canceled except button control. There should be no time delay.
- Exit Force to off mode after signal disappears.
- Accessories are required using TPCDIO07 to extend this function of TSE.

#### Load Shedding and Availability Warning

##### Function:

##### Load shedding

- The emergency power (Genset) sometimes may not afford all loads. A signal from controller sheds some non-critical loads
- Load shedding sends the signal after enabling this function

##### Availability Warning Output

- When transfer switch is not in auto or power lost on two sources, a dry contact outputs the signal.
- After back to Auto status or power recovery, the signal stops.

Compatibility: Active Automatic and Automatic

Rating: 250 VAC, 5 A or 30 VDC, 5 A

Digital output

#### Transfer Inhibit and Remote Testing

##### Function:

##### Transfer Inhibit

- Transfer inhibit when there is power interruption because of short circuit.
- This function can be used to lock the controller by customized signals.
- This function can be used for cooperation with different ATSE .
- Remove transfer inhibit signal to exit this mode.

##### Remote Testing

- Remote testing is an input signal to start test procedure.
- The remote test can only be started at Auto mode.
- For Active Automatic HMI, on load, off load test and time duration can be selected.
- For Automatic HMI, on load test is unlimited.

Compatibility: Active Automatic and Automatic

Dry contact

Digital input

#### Voluntary Remote Control

##### Function:

##### Voluntary transfer to N or A

- Voluntary transfer is an active input. It can transfer the ATSE to Normal or Alternate source according to requirements (such as energy saving).
- Voluntary transfer keeps the power continuity as much as possible. The function is bypassed if target source loses the power. For example, after voluntary to A while A source failed, ATSE transfers back to N if N is available.
- Exit voluntary mode after signal disappeared.

##### Force to OFF

- An emergency stop order to transfer ATSE to OFF position. All the other transfer mode be canceled except handle control.
- Exit force after signal disappeared.

Compatibility: Active Automatic and Automatic

Dry contact

Digital input

## UC Controller Accessories

### BUS Extension and DC 24V Auxiliary Supply Connection Port

**Function:**

**24 VDC Auxiliary Supply**

- For controller when both source failure.
- To keep power for Modbus communication when both source failure.

Compatibility: Active Automatic

Rating: Input Voltage: 24 VDC (-20% ~ +20%), Maximum Input Current: 1 A

**Note:** This device is to connect auxiliary power supply.  
Bus extension feature is not applicable for UC, only 24 Vdc will works.

### Modbus RTU (Serial Port)

**Function:**

**Modbus**

- Can be used to connect with other system.
- Require external 24 V or at least one main source to keep communication.
- With Protocol Modbus RTU communication.

Compatibility: Active Automatic

### Genset Start and Alarm

**Function:**

**Genset Start Output**

- When Utility source has recovered, and ATSE has transferred back to Utility, Genset signal remains until end of Genset cooldown timer.

**Alarm**

- When there is critical alarm, a dry contact outputs the signal.
- Restart controller (open and close dielectric door) to shut down the Alarm.

Compatibility: Active Automatic and Automatic

Rating: 250 VAC, 5 A or 30 VDC, 5 A

Digital output

**Note:** The alarm signal is irrelevant to generator start or stop. It is relevant to transfer errors and phase rotations (for Active automatic version only) errors, for more detail, refer to DOCA0214EN.

### Source Indication

**Function:**

**Source Availability Output**

This function is used for checking source 1 and source 2 status. You can wire indicators to this function module to check source availability without needs to open panel or wire external HMI. It provides two types of output for each source: Source 1/2 in range output and Source 1/2 out of range output.

Compatibility: Active Automatic and Automatic

Dry Contact

Digital output

# Functions and Characteristics

## TransferPacT Controllers

### UC Controller Accessories

#### Gasket

- Standard accessory, IP55 rubber ring: TPCOTH74

#### IK07 Surface Cover

- Optional accessory, protective IK07 cover for controller for outdoor installations. TPCOTH75

#### Bracket

Mounting kits, used to fix the controller and adaptor together.

#### Cables

Used to connect the controller and adaptor.

#### Cables

Used to connect the circuit breakers and adaptor.

# Remote-Operated Source-Changeover Systems

## 2 ComPacT NSX100/630, NS630b/1600 or MasterPacT MTZ1/MTZ2/MTZ3 Devices

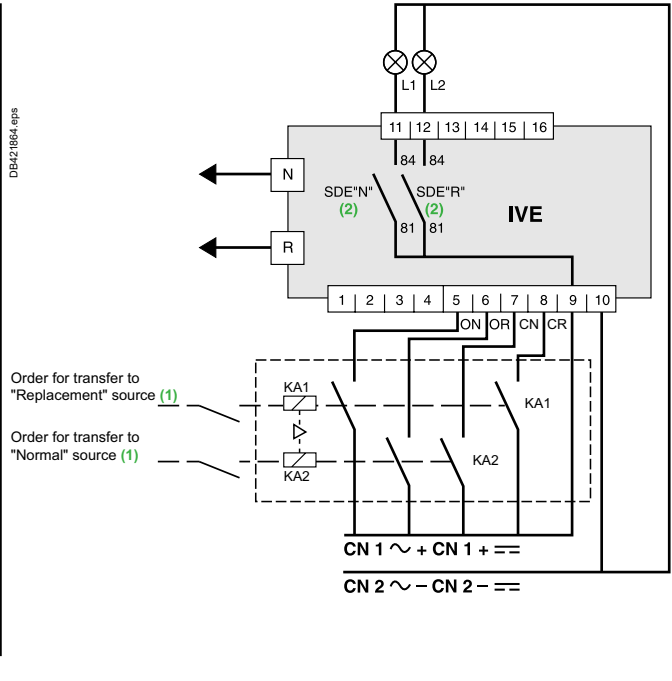

### Electrical Interlocking By The Ive Unit

#### Independent order to Normal/Replacement source

#### Simultaneous order to Normal/Replacement source

Controlling each circuit breaker independently.

Control of two circuit breakers by "common" transfer order.

[1] See section "IMPORTANT" here after.

[2] Operating diagram: the SDE "fault-trip" signals are transmitted to the IVE unit. The SDE auxiliary contacts are mounted in the circuit breakers.

### IMPORTANT

The relays controlling the closing order to the Normal and Replacement circuit breakers must be mechanically and/or electrically interlocked to prevent them from giving simultaneous closing commands.

It is recommended to use **Tesys K** relays from Schneider Electric reference LC2-K06010●●. These relays are mechanically and electrically interlocked.

## 2 ComPacT NS630b/1600 Devices

Diagram no. 51201185

**Electrical Interlocking by IVE Unit with Emergency off by Undervoltage Release**

**ATTENTION**

The diagram shows the electrical wiring for circuit breakers. When wiring the SDE with **switch-disconnectors**, connect wire **BK** to terminal **82**.

- [1] Not to be wired on fixed version.
- [2] Prefabricated wiring supplied.

**Legends**

- QN Normal source ComPacT NS630b to 1600
- QR Replacement source ComPacT NS630b to 1600
- OF... Breaker ON/OFF indication contact
- SDE "Fault-trip" indication contact
- CE1 "Connected-position" indication contact (carriage switch)
- F1 Auxiliary power supply circuit breaker
- IVE Electrical interlocking and terminal block unit
- MN Undervoltage release
- BP Emergency off button with latching
- KA5 Auxiliary relay
- ON Normal source opening order
- OR Replacement source opening order
- CN Normal source closing order (0.25 second delay)
- CR Replacement source closing order (0.25 second delay)
- MT Motor Mechanism

## 2 MasterPacT MTZ1 or MTZ2 or MTZ3 Devices

### Automatic-Control System for Permanent Replacement Source with Lockout after A Fault (with MN)

**ATTENTION**

The diagram shows the electrical wiring for circuit breakers. When wiring the SDE with **switch-disconnectors**, connect wire BK to terminal 82.

- [1] Not to be wired for the "without lockout after a fault" solution.
- [2] Not to be wired on fixed version.
- [3] Prefabricated wiring supplied.

**IMPORTANT**

The relays controlling the closing order to the Normal and Replacement circuit breakers must be mechanically and/or electrically interlocked to prevent them from giving simultaneous closing commands.

It is recommended to use **Tesys K** relays from Schneider Electric reference LC2-K06010●●. These relays are mechanically and electrically interlocked.

- IVE Electrical interlocking and terminal block unit

**Note:** diagram shown with circuits de-energized, circuit breakers open and relays in normal position.

# Source-Changeover Systems with UA Controllers

## Controller Settings

### Source Changeover System with UA Controller

#### Controller Settings

#### Tests on Normal Source Voltage

A = 0 Single-phase test,

A = 1 Three-phase test.

#### Voluntary Transfer (e.g. for Energy Management)

■ Action in the event of genset failure

B = 0 Circuit breaker N opens,

B = 1 Circuit breaker N remains closed.

■ Maximum permissible genset startup time (T<sub>6</sub>)

C = 0 T = 120 s,

C = 1 T = 180 s.

After this time has elapsed, the genset is considered to have failed.

# Source-Changeover Systems with BA Controllers

### Circuit Breakers and Switch-Disconnectors

#### Mechanical Interlocking for Source-Changeover Systems

##### Interlocking

For 2 devices with extended rotary handles

**33890**

##### Interlocking using connecting rods

Complete assembly with 2 adaptation fixtures + rods  
 2 ComPacT fixed devices  
 2 ComPacT withdrawable devices  
 Push button cover (mandatory)

**33910**

**33913**

**2x 33897**

##### Interlocking using cables

Complete assembly with 2 adaptation fixtures + cables  
 2 ComPacT fixed devices  
 2 ComPacT withdrawable devices  
 1 ComPacT fixed + 1 ComPacT withdrawable device  
 Push button cover (mandatory)

**33911**

**33914**

**33915**

**2x 33897**

#### Associated Controller

The automatic-control option includes:

- an IVE electrical-interlocking unit
- an ACP control plate
- a BA or UA controller, depending on the required functions
- a UA/BA adapter kit.

**Note:** the circuit breaker auxiliaries (MCH, MX, XF) and the automatic-control components (IVE, ACP, UA or BA) must have the same voltages.

#### TransferPacT Electrical Interlocking

##### IVE unit

	24 to 250 V DC	48/415 V AC 50/60 Hz 440 V 60 Hz

	Withdr. without chassis (moving part only)		<input type="checkbox"/>	<input type="checkbox"/>
Chassis alone without connections			<input type="checkbox"/>	<input type="checkbox"/>

**MicroLogic Control Unit**

<b>LI</b>	<b>2.X</b>	<input type="checkbox"/>
<b>LSI</b>	<b>5.X</b>	<input type="checkbox"/>
<b>LSIG</b>	<b>6.X</b>	<input type="checkbox"/>
<b>LSIV</b>	<b>7.X</b>	<input type="checkbox"/>
<b>AD</b> - external power-supply module		<input type="checkbox"/> V
<b>TCE</b> - external sensor (CT) for neutral protection		<input type="checkbox"/>
Rectangular sensor for earth-leakage protection	MTZ1 (280 x 115 mm)	<input type="checkbox"/>
	MTZ2/3 (470 x 160 mm)	<input type="checkbox"/>
<b>LR</b> - long-time rating plug	Standard 0.4 to 1 Ir	<input type="checkbox"/>
	Low setting 0.4 to 0.8 Ir	<input type="checkbox"/>
	High setting 0.8 to 1 Ir	<input type="checkbox"/>
	LT OFF	<input type="checkbox"/>
<b>PTE</b> - external voltage measurement input (required for reverse supply)		<input type="checkbox"/>
<b>BAT</b> - battery module		<input type="checkbox"/>

**Communication**

<b>Eco COM module</b>	Modbus	Device	<input type="checkbox"/>	Chassis	<input type="checkbox"/>
Front Display Module (FDM121)		Mounting accessory	<input type="checkbox"/>		<input type="checkbox"/>
Breaker ULP cord	L = 0.35 m		<input type="checkbox"/>		<input type="checkbox"/>
	L = 1.3 m		<input type="checkbox"/>		<input type="checkbox"/>
	L = 3 m		<input type="checkbox"/>		<input type="checkbox"/>
ULP port			<input type="checkbox"/>	IFM	<input type="checkbox"/>
ULP cord			<input type="checkbox"/>	EIFE	<input type="checkbox"/>
I/O module			<input type="checkbox"/>	FDM128	<input type="checkbox"/>
IFE			<input type="checkbox"/>		<input type="checkbox"/>

**Connections**

<b>Horizontal</b>	Top	<input type="checkbox"/>	Bottom	<input type="checkbox"/>
<b>Vertical</b>	Top	<input type="checkbox"/>	Bottom	<input type="checkbox"/>
<b>Front</b>	Top	<input type="checkbox"/>	Bottom	<input type="checkbox"/>
Vertical-connection adapters	MTZ1 - FC fixed, draw.	<input type="checkbox"/>		<input type="checkbox"/>
Cable-lug adapters	MTZ1 - FC fixed, draw.	<input type="checkbox"/>		<input type="checkbox"/>
Arc chute screen	MTZ1 - FC fixed	<input type="checkbox"/>		<input type="checkbox"/>
Interphase barriers	MTZ1 - MTZ2/3 fixed, draw.	<input type="checkbox"/>		<input type="checkbox"/>
Spreaders	MTZ1 fixed, drawout	<input type="checkbox"/>		<input type="checkbox"/>
Disconnectable front connection adapter	MTZ2/3 fixed	<input type="checkbox"/>		<input type="checkbox"/>
Lugs for 240° or 300° cables	MTZ2/3 fixed, drawout	<input type="checkbox"/>		<input type="checkbox"/>
<b>VO</b> - safety shutters on chassis	MTZ1, MTZ2/3			<input checked="" type="checkbox"/>
<b>VIVC</b> - shutter position indication and locking	MTZ2/3			<input type="checkbox"/>

### Indication Contacts

**OF - ON/OFF indication contacts**

Standard	4 OF 6 A-240 V AC (10 A-240 V AC and low-level for MTZ2/3)		
Additional	1 block of 4 OF for MTZ2/3	max. 2	qty <input type="checkbox"/>

**EF - combined "connected/closed" contacts**

	1 EF 6 A-240 V AC for MTZ2/3	max. 8	qty <input type="checkbox"/>
	1 EF low-level for MTZ2/3	max. 8	qty <input type="checkbox"/>

**SDE - "fault-trip" indication contact**

Standard	1 SDE 6 A-240 V AC		
Additional	1 SDE 6 A-240 V AC	<input type="checkbox"/>	1 SDE Low level <input type="checkbox"/>

**Programmable contacts**

Carriage switches	6 A-240 V AC	<input type="checkbox"/>	2 M2C contacts <input type="checkbox"/>
			Low level <input type="checkbox"/>

**CE - "connected" position** max. 3 for MTZ2/3 / MTZ1 qty

**CD - "disconnected" position** max. 3 for MTZ2/3, 2 for MTZ1 qty

**CT - "test" position** max. 3 for MTZ2/3, 1 for MTZ1 qty

**AC** - MTZ2/3 actuator for 6 CE - 3 CD - 0 CT additional carriage switches qty

### Remote Operation

**Remote ON/OFF**

<b>MCH</b> - gear motor		V	<input type="checkbox"/>
<b>XF</b> - closing voltage release		V	<input type="checkbox"/>
<b>MX</b> - opening voltage release		V	<input type="checkbox"/>
<b>PF</b> - "ready to close" contact	Low level 6 A-240 V AC		<input type="checkbox"/>
<b>BPFE</b> - electrical closing pushbutton			<input type="checkbox"/>
<b>Res</b> - electrical reset option		V	<input type="checkbox"/>
<b>RAR</b> - automatic reset option			<input type="checkbox"/>

**Remote tripping**

<b>MN</b> - undervoltage release		V	<input type="checkbox"/>
<b>R</b> - delay unit (non-adjustable)			<input type="checkbox"/>
<b>Rr</b> - adjustable delay unit			<input type="checkbox"/>
<b>2<sup>nd</sup> MX</b> - shunt release		V	<input type="checkbox"/>

### Locking

**VBP** - ON/OFF pushbutton locking (by transparent cover + padlocks)

**OFF position locking:**

**VCPO** - by padlocks

**VSP0** - by keylocks

Keylock kit (w/o keylock)	Profalux	<input type="checkbox"/>	Ronis	<input type="checkbox"/>
	Kirk	<input type="checkbox"/>	Castell	<input type="checkbox"/>
1 keylock	Profalux	<input type="checkbox"/>	Ronis	<input type="checkbox"/>
2 identical keylocks, 1 key	Profalux	<input type="checkbox"/>	Ronis	<input type="checkbox"/>
2 keylocks, different keys (MTZ2/3)	Profalux	<input type="checkbox"/>	Ronis	<input type="checkbox"/>

**Chassis locking in "disconnected" position:**

**VSPD** - by keylocks

Keylock kit (w/o keylock)	Profalux	<input type="checkbox"/>	Ronis	<input type="checkbox"/>
	Kirk	<input type="checkbox"/>	Castell	<input type="checkbox"/>
1 keylock	Profalux	<input type="checkbox"/>	Ronis	<input type="checkbox"/>
2 identical keylocks, 1 key	Profalux	<input type="checkbox"/>	Ronis	<input type="checkbox"/>
2 keylocks, different keys	Profalux	<input type="checkbox"/>	Ronis	<input type="checkbox"/>
Optional connected/disconnected/test position locking				<input type="checkbox"/>

**VPEC** - door interlock

	On right-hand side of chassis	<input type="checkbox"/>
	On left-hand side of chassis	<input type="checkbox"/>

**VPOC** - racking interlock

**IPA** - cable-type door interlock

**IBPO** - racking interlock between crank and OFF pushbutton for MTZ2/3

**DAE** - automatic spring discharge before breaker removal for MTZ2/3

**VDC** - mismatch protection device - chassis

### Accessories

**CDM** - mechanical operation counter

**CB** - auxiliary terminal shield for chassis

**CDP** - escutcheon

**CP** - transparent cover for escutcheon

**OP** - blanking plate for escutcheon

Brackets for mounting MTZ2/3 fixed  On backplates

# Order Form for Source-Changeover Systems for 3 Devices

## MasterPacT MTZ2/MTZ3

### Circuit Breakers and Switch-Disconnectors

To indicate your choices, check the applicable square boxes  and enter the appropriate information in the rectangles .

(one sheet per device, make copies if necessary)

Device identification:

**Q 1 - NORMAL SOURCE**

**Q 2 - REPLACEMENT SOURCE**

#### Circuit breaker or Switch-Disconnecter

MasterPacT type	<b>MTZ2/MTZ3</b>	<input type="checkbox"/>
Rating	<b>A</b>	<input type="checkbox"/>
Sensor rating	<b>A</b>	<input type="checkbox"/>
Circuit breaker	<b>N1, H1, H2, H3, L1</b>	<input type="checkbox"/>
Switch-disconnector	<b>NA, HA, HF</b>	<input type="checkbox"/>
Number of poles	<b>3 or 4</b>	<input type="checkbox"/>
Option: neutral on right side		<input type="checkbox"/>
Device	Fixed	<input type="checkbox"/>
	Drawout with chassis	<input type="checkbox"/>
	Drawout without chassis (moving part only)	<input type="checkbox"/>
Chassis alone without connections		<input type="checkbox"/>

#### MicroLogic Control Unit

<b>LI</b>	<b>2.X</b>	<input type="checkbox"/>
<b>LSI</b>	<b>5.X</b>	<input type="checkbox"/>
<b>LSIG</b>	<b>6.X</b>	<input type="checkbox"/>
<b>LSIV</b>	<b>7.X</b>	<input type="checkbox"/>
<b>AD</b> - external power-supply module	<b>V</b>	<input type="checkbox"/>
<b>TCE</b> - external sensor (CT) for neutral protection		<input type="checkbox"/>
Rectangular sensor	470 x 160 mm	<input type="checkbox"/>
for earth-leakage protection		<input type="checkbox"/>
<b>TCW</b> - external sensor for SGR protection		<input type="checkbox"/>
<b>LR</b> - long-time rating plug	Standard 0.4 to 1 Ir	<input type="checkbox"/>
	Low setting 0.4 to 0.8 Ir	<input type="checkbox"/>
	High setting 0.8 to 1 Ir	<input type="checkbox"/>
	LT OFF	<input type="checkbox"/>
<b>PTE</b> - external voltage measurement input (required for reverse supply)		<input type="checkbox"/>
<b>BAT</b> - battery module		<input type="checkbox"/>

#### Communication

<b>Eco COM module</b> Modbus	Device	<input type="checkbox"/>	Chassis	<input type="checkbox"/>
Front Display Module (FDM121)	Mounting accessory	<input type="checkbox"/>		<input type="checkbox"/>
Breaker ULP cord	L = 0.35 m	<input type="checkbox"/>		<input type="checkbox"/>
	L = 1.3 m	<input type="checkbox"/>		<input type="checkbox"/>
	L = 3 m	<input type="checkbox"/>		<input type="checkbox"/>
ULP port		<input type="checkbox"/>	IFM	<input type="checkbox"/>
ULP cord		<input type="checkbox"/>	EIFE	<input type="checkbox"/>
I/O module		<input type="checkbox"/>	FDM128	<input type="checkbox"/>
IFE		<input type="checkbox"/>		<input type="checkbox"/>

#### Connections

<b>Horizontal</b>	Top	<input type="checkbox"/>	Bottom	<input type="checkbox"/>
<b>Vertical</b>	Top	<input type="checkbox"/>	Bottom	<input type="checkbox"/>
<b>Front</b>	Top	<input type="checkbox"/>	Bottom	<input type="checkbox"/>
Interphase barriers	Fixed, drawout	<input type="checkbox"/>		<input type="checkbox"/>
Disconnectable front connection adapter	Fixed	<input type="checkbox"/>		<input type="checkbox"/>
<b>VO</b> - safety shutters on chassis		<input checked="" type="checkbox"/>		<input type="checkbox"/>
<b>VIVC</b> - shutter position indication and locking		<input type="checkbox"/>		<input type="checkbox"/>

#### Indication Contacts

<b>OF - ON/OFF indication contacts</b>			
Standard	4 OF 6 A-240 V AC (10 A-240 V AC and low-level)		
Additional	1 block of 4 OF	max. 2	qty <input type="checkbox"/>
<b>EF - combined "connected/closed" contacts</b>			
	1 EF 6 A-240 V AC	max. 8	qty <input type="checkbox"/>
	1 EF low-level	max. 8	qty <input type="checkbox"/>
<b>SDE - "fault-trip" indication contact</b>			
Standard	1 SDE 6 A-240 V AC		
Additional	1 SDE 6 A-240 V AC	<input type="checkbox"/>	1 SDE Low level <input type="checkbox"/>
<b>Programmable contacts</b>			
			2 M2C contacts <input type="checkbox"/>
Carriage switches	6 A-240 V AC	<input type="checkbox"/>	Low level <input type="checkbox"/>
<b>CE</b> - "connected" position	Max. 3		qty <input type="checkbox"/>
<b>CD</b> - "disconnected" position	Max. 3		qty <input type="checkbox"/>
<b>CT</b> - "test" position	Max. 3		qty <input type="checkbox"/>
<b>AC</b> - MTZ2/3 actuator for 6 CE - 3 CD - 0 CT additional carriage switches			qty <input type="checkbox"/>

#### Remote Operation

<b>Remote ON/OFF</b>	<b>MCH</b> - gear motor	<b>V</b>	<input type="checkbox"/>
	<b>XF</b> - closing voltage release	<b>V</b>	<input type="checkbox"/>
	<b>MX</b> - opening voltage release	<b>V</b>	<input type="checkbox"/>
	<b>PF</b> - "ready to close" contact	Low level	
			6 A-240 V AC <input type="checkbox"/>
	<b>BPFE</b> - electrical closing pushbutton		<input type="checkbox"/>
	<b>Res</b> - electrical reset option	<b>V</b>	<input type="checkbox"/>
	<b>RAR</b> - automatic reset option		<input type="checkbox"/>
<b>Remote tripping</b>	<b>MN</b> - undervoltage release	<b>V</b>	<input type="checkbox"/>
	<b>R</b> - delay unit (non-adjustable)		<input type="checkbox"/>
	<b>Rr</b> - adjustable delay unit		<input type="checkbox"/>
	<b>2<sup>eme</sup> MX</b> - shunt release	<b>V</b>	<input type="checkbox"/>

#### Locking

<b>VBP</b> - ON/OFF pushbutton locking (by transparent cover + padlocks)				<input type="checkbox"/>	
<b>OFF position locking:</b>					
<b>VCPO</b> - by padlocks					
<b>VSPD</b> - by keylocks	Keylock kit (w/o keylock)	Profalux	<input type="checkbox"/>	Ronis	<input type="checkbox"/>
		Kirk	<input type="checkbox"/>	Castell	<input type="checkbox"/>
	1 keylock	Profalux	<input type="checkbox"/>	Ronis	<input type="checkbox"/>
	2 identical keylocks, 1 key	Profalux	<input type="checkbox"/>	Ronis	<input type="checkbox"/>
	2 keylocks (MTZ2/3)	Profalux	<input type="checkbox"/>	Ronis	<input type="checkbox"/>
<b>Chassis locking in "disconnected" position:</b>					
<b>VSPD</b> - by keylocks	Keylock kit (w/o keylock)	Profalux	<input type="checkbox"/>	Ronis	<input type="checkbox"/>
		Kirk	<input type="checkbox"/>	Castell	<input type="checkbox"/>
	1 keylock	Profalux	<input type="checkbox"/>	Ronis	<input type="checkbox"/>
	2 identical keylocks, 1 key	Profalux	<input type="checkbox"/>	Ronis	<input type="checkbox"/>
	2 keylocks, different keys	Profalux	<input type="checkbox"/>	Ronis	<input type="checkbox"/>
	Optional connected/disconnected/test position locking				
<b>VPEC</b> - door interlock			On right-hand side of chassis	<input type="checkbox"/>	
			On left-hand side of chassis	<input type="checkbox"/>	
<b>VPOC</b> - racking interlock				<input type="checkbox"/>	
<b>IPA</b> - cable-type door interlock				<input type="checkbox"/>	
<b>IBPO</b> - racking interlock between crank and OFF pushbutton for MTZ2/3				<input type="checkbox"/>	
<b>DAE</b> - automatic spring discharge before breaker removal for MTZ2/3				<input type="checkbox"/>	
<b>VDC</b> - mismatch protection				<input type="checkbox"/>	

#### Accessories

<b>CDM</b> - mechanical operation counter	<input type="checkbox"/>
<b>CB</b> - auxiliary terminal shield for chassis	<input type="checkbox"/>
<b>CDP</b> - escutcheon	<input type="checkbox"/>
<b>CP</b> - transparent cover for escutcheon	<input type="checkbox"/>
<b>OP</b> - blanking plate for escutcheon	<input type="checkbox"/>
Brackets for mounting MTZ2/3 fixed	On backplates <input type="checkbox"/>
