Environmental Data Program

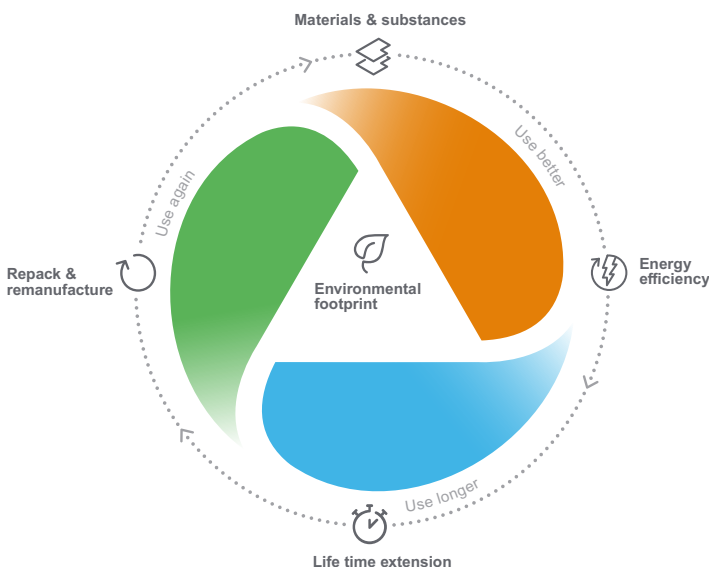

Next-level transparency for better-informed product choices

The Environmental Data Program is a framework for how we measure, categorize, and compare the environmental attributes and footprint of our products.

Using a rigorous, fact-based methodology, the program provides environmental data from across the product lifecycle.

Five data categories across the product lifecycle

Use Better: How sustainable a product is, including environmental footprint, materials and substances, packaging, and energy efficiency.

Use Longer: How a product's life time can be effectively extended in terms of repairability and updatability.

Use Again: How a product can be reused, from dismantling and remanufacturing to recyclability and manufacturer take back.

With this transparent, verified data, customers and partners are empowered to make conscious environmental choices and accurately evaluate and report on sustainability performance.

All our hardware offers have an associated environmental data available on se.com product pages.

Learn more about the **Environmental Data Program**

An alternative approach to electrical protection

The essentials of electrical protection

Schneider Electric is committed to bringing you one of the most flexible and comprehensive fuse device offer on the market. We bring you essential functions combined with advanced features such as measurement and turnable hooks to deliver a “best in class” solution that provides electrical protection for your industrial applications with single and double breaking switch fuses.

Fuse devices are designed to perform three functions for electrical protection:

- Switch function for circuit on-load control
- Fuse function against short-circuits and overloads
- Isolation from the power circuit.

A complete solution

Schneider Electric offers complete electrical protection for distribution systems including fuse devices that fully integrate in Schneider's functional enclosures (Prisma) and busbar trunking systems (Canalis)

Simple and flexible

- Easy to install and flexible in terms of footprint, cable connections, and product position. Includes mounting plates or can be mounted directly onto busbars or DIN rail.
- Easy to operate and simple to maintain

Fully compatible

Fusegear solutions have been designed to be used with all fuse-links and complying with standard:

- IEC 60269-1 and -2

Fully certified

Fuse offer complies with international standards, certifications and markings:

- IEC 60947-1 and -3
- CCC certificates
- EAC certificates

FuPacT ISFL
160 to 1250 A

FuPacT ISFT
100 to 630 A

Single breaking offer: Fuse switch disconnectors

Functions:

- Short-circuit and overload protection
- Isolation
- On-load switching of circuits

- High level of reliability against short-circuits
- High flexibility on busbar systems thanks to its turnable hooks
- Opening and closing operations are dependent on the operator's action

Built to connect by design

All Schneider Electric components, from electrical devices and busbars, to splitter blocks and switchboards, work together for optimal performance. Their electrical and mechanical functions and communications features integrate seamlessly.

Our range of fuse devices provides:

- Protection for people and property
- Energy quality and availability
- Performance and high uptime
- Easy operation, thanks to standard operating process and simple maintenance.

Combine efficiency and intelligent control thanks to the fuse monitor

Available for the ISFL and ISFT FuPacT ranges, the fuse monitor is more than just an accessory. Its protection and monitoring functions makes it indispensable:

- A monitor solution for the range
- Automatic reset of the fuse monitor once blown fuse is replaced
- Auxiliary contacts for different functions: alarm, tripping of a remote device
- No need of striker fuses, leading to a significant cost reduction

FuPacT GS
32 to 1250 A

Double breaking offer: Switch disconnecter fuses

Functions:

- Short-circuit and overload protection
- Isolation
- On-load switching of circuits

- High level of protection thanks to upstream and downstream double breaking
- Fast opening and closing
- Opening and closing operations occur independently of the operator's action

SINGLE BREAKING FUSE SOLUTIONS
FuPacT ISFT - FUSE SWITCH DISCONNECTORS

FuPacT ISFT devices

FuPacT ISFT helps you remain competitive in today's market. Its features offer more flexibility in terms of mounting and cabling.

FuPacT ISFT is also the smallest product of the market at just 53 mm width for NH 000 fuse-links (100 A).

Fuse switch disconnectors can be mounted and fixed effortlessly!

- **Less stock:** FuPacT ISFT range includes turnable hooks to enable downstream or upstream distribution with the same product.
- **Save time:** less assembling steps. The product can be fixed very quickly for a faster mounting.
- **Enhanced safety:** the product offers optimized user protection against arc flash.

Snap-on busbar cover

- Avoid any risk of coming into contact with busbars

Turnable hooks

- Allows top or bottom cable outlet
- Faster and flexible mounting on the busbar
- Adapted to 60 mm busbar systems

Designed for secondary switchboards

Integrated and extended hand protection

- Prevents fuse-link contact
- Protection against electric arcs

Device locking

- Devices can be sealed and locked

Slidable windows

- Enabling independent testing of individual fuse-links

The smallest product on the market ISFT 100N (100 A)

Less space needed (53 mm width instead of standardized 106 mm)

FuPacT ISFT and ISFL combine efficiency and intelligent control and reduce costs:

The fuse monitor provides:

- Precise location and fast correction of short-circuit and overload faults
- No need of striker-type fuses
- Auxiliary contacts for different functions: alarm, tripping of a remote device, etc.
- Automatic reset of the fuse monitor after blown fuse is replaced

SINGLE BREAKING FUSE SOLUTIONS
FuPacT ISFL - FUSE SWITCH DISCONNECTORS

More flexibility with FuPacT ISFL

FuPacT ISFL is one of the most efficient vertical fuse switch disconnectors ever designed with a compact form and a modular system.

Thanks to its size, FuPacT ISFL doesn't require extra space for current transformer installation. Its interface is standardized for all types of measurement devices.

Measuring device

- Energy consumption control is feasible by the easy installation of a measuring device

Easy to hook

- Turnable contact hooks available for FuPacT ISFL 160 A 3-pole (60 mm busbars)
- Fast mounting with reduced manual operations
- Adapted to all busbar systems: 60/100/185 mm, present in main switchboards

Designed for main switchboards

Fuse monitor

- Precise location and fast correction of short-circuit and overload faults
- Usable only with U < 690 V AC

- Fast connection with variable box terminals

FuPacT ISFL is available in two different versions

- 1-pole switchable dedicated to 185 mm busbars
- 3-pole switchable available for 60/100/185 mm busbars

Same length and depth for size 00 (160 A) to size 3 (630 A)

DOUBLE BREAKING FUSE SOLUTIONS
FuPacT GS - SWITCH DISCONNECTOR FUSES

High performance thanks to FuPacT GS

FuPacT GS offer provides protection for personnel thanks to its double isolation, upstream and downstream when the switch is open.

It also provides high system availability in buildings, infrastructure and even in industrial plants. It is compatible with fuse-links BS, NFC and NH.

3 ways to command FuPacT GS:
front and lateral extended handle for all ratings
and direct handle from 32 to 400 A

Transparent fuse covers
for an easy reading of the fuse type

• Front extended handle

Common auxiliary contacts
from 32 to 1250 A
and auxiliary contacts
with pre-cut function

External neutral module
for direct neutral, not switch,
in the same form factor as poles

• Direct extended handle

Handle with 3 positions
ON, OFF, TEST

• Lateral handle

Improve your power distribution with FuPacT GS

- Distribution switchboards.
- Disconnection, isolation, locking and primary control of incoming circuits.
- Categories AC21/AC22 for electrical distribution, AC23 for motor feeders.

+ Power and control your industrial motors with FuPacT GS

- Motor starters: DOL, Star-Delta, softstarters.
- Variable speed starters with frequency converters.
- Machine types: HVAC units, industrial cranes, hoists.
- Industries: paper, steel, ports, automotive, power, mining, rail, oil & gas.

Powering solar efficiency with FuPacT ISFL

Our medium and low-voltage solutions help optimize the string inverter architectures increasingly preferred for solar farm applications while delivering important benefits to you and your developer customers.

AC21B – Compliant for 800 V AC Solar Applications!

The solar farm market is soaring. Yearly installations almost doubled in 2023, exceeding the previous year by 87% [1]. Global investment in the solar sector is rising while wind investments are slowing down. As a result of this, solar maintenance and supervision services are growing to ensure solar farms operate efficiently, reliably, and sustainably.

What's driving solar development?
Residential, commercial, and industrial customers are turning to renewables to reduce their CO2 footprint, advance ESG goals, comply with government regulations, and achieve long-term cost savings.

Skyrocketing demand

[1] New report: Global solar installations almost double in 2023 but leaves emerging economies in the dark
[2] Schneider Electric Solar Farm Campaign Brief

Empowering Solar Projects: From Design to Delivery

With developers eager to respond to the growing demand for renewable energy, the solar farm market presents significant business opportunities to Schneider Electric partners. Design firms, panel builders, and electrical contractors can help developers overcome four main challenges they face:

Capital costs and time to market

Developers need to design, build, and deliver solar farms faster while optimizing their Levelized Cost of Energy (LCOE), which is the average cost of energy produced by a solar installation over its lifetime.

Operations and maintenance efficiency

To succeed, solar farms need to be highly efficient. Developers must optimize operations while safeguarding people and assets and ensuring system reliability and security.

Energy and revenue demands

Developers need to improve solar farm energy yield and generate new revenue streams in anticipation of the end of their government FITs, the feed-in tariffs that ensure an above-market price for the energy they provide to the grid.

Grid integration and repowering

Developers must help future power grids prepare for the rising demand for clean and renewable power.

Fuse Recommendation

Schneider Electric provides a fuse-link offer with NH fuses to a complete solution for our customers.

We offer fuse-links with different curves, available without strikers:

- Fuse-links type aM

Protection of equipment with current peaks like motor applications.

- Fuse-links type gG

Protection of circuits without significant electrical distribution current peaks.

Functional installation

in Prisma product range

Easy implementation

FuPacT fusegear can be installed on mounting plates or mounted directly on the busbar from 60 to 185 mm.
Easy installation with special components for each type of mounting and clear instructions in accordance with standard working practices.

Multiple combinations in switchboard

FuPacT ISFL devices can be installed in the same rows with all the different ratings.
Same accessories are existing to have the same length and new products have been developed to have same length and depth.
Depending on the rating, 6 to 9 devices can be installed per row.

Simplified distribution in switchboard

FuPacT ISFT100 and 160 can be supplied via feeding busbars connected to the main busbars.
All FuPacT ISFT range (except 630 A rating) can be supplied directly by busbars with connection by hook-on.

Full functional-unit performance

Prisma offers a complete set of mounting plates, front plates and prefabricated connection accessories for FuPacT that helps ensure performance and ease of installation.

General description of FuPacT fusegear

2

ISF● fuse-switch disconnectors

FuPacT ISF● (ISFT and ISFL)

ISFT horizontal fuse-switch disconnectors and ISFL vertical fuse-switch disconnectors have the following functions:

- On-load switching of circuits. The speed and force of the operation of this type of fusegear are dependent on the action of the operator
- The fuse-link blades form the moving contacts of the switch
- The fuse-links are mounted in a fuse-carrier assembly
- Via the handle, the fuse-carriers operate the main moving contacts
- Isolation when the fuse-carrier assembly is in the open position (OFF)
- Protection against short-circuits and overloads on distribution circuits. This function is provided by DIN blade-type industrial fuse-links (NH).
- Possibility for ISFL vertical fuse-switch disconnectors to have a 1-pole or 3-pole variant.
- Turnable contact hooks which is advantage in terms of installation. Possibility to have an upstream or downstream distribution with the same product.

ISF● fuse-switch disconnectors

ISFT with turnable hooks

FuPacT GS (GSC, GSD and GSB)

FuPacT GS switch-disconnector fuses provide the following functions:

- On-load switching of circuits. The speed and force of the operation of this type of fusegear are independent of the action of the operator (fast opening and closing).
- Isolation with positive contact indication when the switch is in the open position (OFF). The fuse-link is completely isolated from the power circuit (double breaking technology).
- Protection against short-circuits and overloads on distribution circuits. This function is provided by industrial fuse-links (NFC, DIN, BS) used in conjunction with the switch-disconnector fuse device.
- Safety or emergency stop (red/yellow rotary handle option).

GS● switch-disconnector fuses

FuPacT operating modes

The FuPacT range integrates control, isolation and fuse-carrier functions in a single device. These functions can also be implemented by combining separate components.

FuPacT GS switch-disconnector fuses

Solutions combining separate components

It is also possible to protect distribution circuits and/or motors by combining switch-disconnectors with fuse-links mounted on separate fuse-carriers.

The functions provided by each component are:

- On-load switching of circuits (opening and closing) and isolation (switch-disconnector).
- Protection against overloads and short-circuits (fuse).
- The combination can implement Compact INS or INV switch-disconnectors from 40 to 2500 A.

Control

Protection

INS switch-disconnectors

Fuse-link

General description of FuPacT fusegear

Compliance with standards

FuPacT fusegear complies with international standards and recommendations:

- IEC 60947-1: general rules
- IEC 60947-3: switches, disconnectors
- IEC 60947-5.1 and following: control-circuit devices and switching elements; automatic control components.

These standards and recommendations are applied in most countries.

FuPacT fusegear and auxiliaries comply with International standards (IEC 60947-1 and IEC 60947-3).

FuPacT GS and FuPacT ISF● are designed for use with industrial fuse-links complying with the following standards:

- IEC 60269
- BS 88 (only for FuPacT GS)
- DIN 43620 / VDE 0636.

FuPacT GS switch-disconnector fuses are suitable for the control of machine-tools:

- They comply with the requirements of the new machine directive IEC 60204 (EN 60204)
- They comply with French standard NF C 79-130 and the recommendations issued by the CNOMO organisation.

Climatic environment

FuPacT fusegear meets climatic requirements as defined in the following standards:

- IEC 60068-2-30: damp-heat tests under off-load conditions, 95 % relative humidity at 55 °C (hot and humid climate conditions)
- IEC 60068-2-52: salt-mist tests, KB severity 2 tests
- IEC 60068-2-56: damp-heat tests under on-load conditions for 48 hours, environment category C2 following Schneider quality specifications.

The fusegear can therefore be used in all climates.

Degree of pollution

FuPacT fusegear is certified for operation in pollution-degree 3 environments as defined by IEC 60947 standard applying to industrial environments.

Ambient temperature

The FuPacT range can be used between -20 °C and +70 °C. Above 40 °C, you will have to take account of the derating indicated in the documentation.

The devices must be commissioned at the ambient temperature indicated above.

The FuPacT range must be stored in its original packaging at a temperature between -50 °C and +85 °C.

Degree of protection

For FuPacT fusegear with terminal shield, the degree of protection against direct contact complies with standard IEC 60529 (IP index of protection) and IEC 62262:

- With direct rotary handle: IP20/IK07
- With extended rotary handle (FuPacT GS): IP65/IK10
- With extended rotary handle and padlocks: IP65/IK08.

Positive contact indication

IEC 60947-3 standard defines isolation with positive contact indication as follows:

- The isolation position corresponds to the O (OFF) position
- The operating handle cannot indicate the OFF position unless the main contacts are not totally opened
- Locking in the OFF position is not possible unless the main contacts are actually open.

GS● switch-disconnector fuses are suitable for isolation with positive contact indication.

Installation of an extended handle on GS● fusegear does not alter the suitability for isolation.

The isolation with positive contact indication function is certified by testing:

- The mechanical reliability of the position-indication system
- The absence of leakage currents
- Overvoltage withstand capacity between upstream and downstream connections.

FuPacT ISFT offers innovative solutions

The FuPacT ISFT is a modern approach to power distribution with modular switchgear that is simple to install and reliable.

On the FuPacT ISFT the entire covers can easily be removed while the switching cover remains closed, thus eliminating the need for elaborate trim frames and extensions.

Integrated hand protection and a sliding viewing window enable voltage tests to be conducted on contact blades or strap handles. FuPacT ISFT offers two types of cable connection: cable lug or clamp connector for copper or aluminum conductors. All FuPacT ISFT can be sealed and fitted with a locking mechanism. FuPacT ISFT also provides a patented system of turnable hooks for converting the outgoing arrangement from top to bottom and vice versa. The fuse-switch-disconnectors can be attached, positioned and tightened effortlessly.

Smallest 100 A solution on market: ISFT100N

FuPacT ISFT offers two sizes for 100 A rating.

- Basic (without connection on busbar system), with a width of 106 mm.
- Narrow, which is the smallest 100 A solution on the market (connection on busbar system possible), with a width of 53 mm.

Objectives of this product is to reduced installation space and to propose two 100 A (106 mm width) replace one 160 A product (106 mm width also).

FuPacT ISFT for mounting on base plates

The disconnectors for mounting on base plates, sizes 000, 00, 1, 2 and 3, come with a number of predrilled fastening holes that allow these models to be used on base plates or on profiles. With the appropriate accessories, the sizes 000 and 00 can be mounted on DIN rail.

Accessories

Support Profile Laterally attachable

This accessory allows to enlarge the cut-out tolerances of the cover plates while also supporting these plates.

- Latchable bracket on the side.
- Allows greater cutting tolerances.

Switching cover position indicator:

- 1 close contact and 1 open contact.

Intelligent measurement

Electronic Fuse-Monitoring - Everything under control

Thanks to the electronic Fuse Monitor, technician could receive an information to localize a short circuit or overload. Maintenance will be more reactive to change fuse which is broken.

FuPacT ISFT range from size 00 to 3 has an electronic fuse monitor. The electronic fuse monitor is directly attached to the switching cover. This installation depth is 28 mm.

A light-emitting diode starts blinking red the moment the fuses fail. A test button and a 4-pole connector for remote indication are attached to the housing.

Note: for more technical informations, see [page A-22](#).

Functions and characteristics

General characteristics: ISFT

FuPacT ISFT100N to ISFT630

Safety

FuPacT ISFT provides:

- Protection against accidental contact in the standard model:
 - Terminal housing closed
 - Simple break-out for all versions
 - Terminal shield needed for specific application (> 500 V)
 - IP3X
 - Life part are covered.
- Switching with integrated and extended hand protection feature:
 - Prevents fuse-unit contact
 - Protection against electric arc.
- Voltage test thanks to independent slidable windows
- Snap-on busbar cover to protect against direct contact.
- Locking cover with sealing facility:
 - Locking mechanism for switching cover for non-instructed individuals
 - Switching cover is sealable.

Fast connection thanks to box terminals

For FuPacT 160 A size 00

- Advantageous box terminals:
 - Cu conductor from 2,5 to 95 mm²
 - No cable lug needed.
- Or universal screw terminal for M8 cable lug.

Options

- Prism clamp 6...70 mm² Cu/Al.
- Terminal 3 x 16 mm².

For FuPacT 250 to 630 A sizes 1–3

- The standard version:
 - Size 1 and 2 for M10 cable lug
 - Size 3 for M12 cable lug.
- Easy to change the various types of connection.

Options

- Prism clamp for Cu.
- Prism clamp for Cu/Al (1x cable).
- Prism clamp for Cu/Al (2x cables).

Turnable contact hooks

FuPacT ISFT is the first horizontal fuse switch-disconnector to propose turnable contacts hooks. This makes it easier to mount FuPacT ISFT on the busbar in addition to being more flexible. Due to its symmetry, FuPacT ISFT can be turned around at any time. Terminal top or bottom can be chosen freely. Thus, only one version needs to be stored.

- One universal solution for top or bottom cable outlet.
- Reduced stock.
- Universal to busbar thickness.
- More installation flexibility.

ISFT installation

FuPacT ISFT100N to ISFT630

ISFT fusegear is installed on a mounting plate, DIN rail or on busbars, depending on the power rating. Connections are made via cables or directly to the busbars via hook-on.

A

FB117721_L32.eps

ISFT100N (hook-on connection)

DB120057.eps

Hook-on connection to busbars: the device tightly hooks on to the busbars via three hooks that allows for both electrical connection and performant mechanical mounting. The connection systems can also be reversed to supply distribution circuits via the upstream terminals.

This system allows direct contact of the power circuit to the busbars (no cables, no bars, no drilling, etc.) and usual connections for downstream distribution (bare cable connectors, lugs, bars, distribution connectors, etc.).

ISFT100N fusegear

Installation on a mounting plate, on busbars 60 mm or DIN rail on busbars with:

- Cables or flexible bars
- Hook-on connection to 60 mm busbars.

Upstream or downstream connection of distribution circuits requires cables or flexible bars.

Connection and accessories

FuPacT ISFT100N to ISFT630 - Connection

FuPacT fuse-switch disconnectors can supply distribution circuits via either the upstream or downstream terminals. Devices intended for connection to busbars are configured as standard for distribution via the downstream terminals.

A

ISFT fusegear is equipped with connectors or terminals for front connection of:

- Bare cables for ISFT100N to ISFT160 devices
- Cables with lugs for ISFT160 to 630 devices
- Flexible bars for ISFT160 to 630 devices.

Connection and accessories

FuPacT ISFT160 to ISFT630 - Reverse distribution

FuPacT fuse-switch disconnectors designed for connection to busbars supply distribution circuits via the downstream terminals as standard. In the case of ISFT160 to ISFT630 devices, simple installation operations allow power to be supplied to the distribution circuits from upstream. In the case of ISFT100N devices, the method of distribution cannot be reversed simply by changing the direction of the mounting. There are separate references for each particular case.

A

DB120103.eps

Hook-on connection: the orientation of the hooks on the busbars is always the same, whether the distribution circuits are connected to the upstream or downstream terminals. The fuse-switch disconnectors must physically hang on the busbars.

DB120104.eps

Symmetrical slots on the side of the base make it possible to raise and lower the cover that forms the fuse-carrier.

To reverse supply, depending on the model, simply turn 180°:

- Either the base with its connection kit
- Or the connection kit alone.

For fusegear with a fuse monitor, the fuse monitor cover must be changed given that different versions are used depending on whether supply is via the upstream or downstream terminals.

Operation to reverse supply (upstream/downstream terminals)

Connection and accessories

FuPacT ISFT100 and ISFT160 - Connection, coupling

It is possible to supply several ISFT100 and ISFT160 fusegears by using feeding busbars via a single incomer.

Supplying a several of devices via feeding busbars

Incoming connectors are used for the upstream power cables. Power is distributed to the other devices via feeding busbars or a combination of feeding busbars. Downstream connection of distribution circuits is done via cables.

ISFT100

2 devices

ISFT160

3 devices

4 devices

Combinations:

- 2 devices:
 - 1 incomer for 2 outgoing
- 3 devices ^[1]:
 - 1 incomer for 3 outgoing
- 4 devices ^[1]:
 - 1 incomer for 4 outgoing.

If the feed is connected at the center of the busbar, the total outgoing current of each busbar branch must not exceed the maximum busbar current per phase.

[1] For combinations of more than 2 ISFT100 devices, it is recommended to connect incoming power to the second device to reduce temperature rise.

Feeding busbars

Maximum operating voltage	690 VAC
Insulation coordination	overvoltage category III / pollution degree 2
Busbar cross-section	35 mm ²

The maximum current per phase when the feed is connected to a busbar extremity is 125 A. The maximum current per phase when the feed is connected at any busbar position is 160 A.

Connection and accessories

Fuse monitor

FuPacT ISFT160 to ISFT630

PE115845.eps

ISFT160 fuse monitor

A

Functions

This device provides remote indication of the status of standard fuses (without strikers). It is used to:

- Indicate a blown fuse
- Prevent the risks of abnormal voltages on the neutral
- It can only be used with $U < 690$ V AC.

Standards

- Compliance with international standard IEC 60947-5-1.
- Compliance with:
 - EN 50204
 - EN 61000 for electromagnetic compatibility (EMC).

Description

- Characteristics:
 - Operation with DIN fuses.
 - Degree of protection: IP20.
- May be used on capacitor bank circuits.
- Simplified power supply:
 - Does not require a specific power supply
 - Operates with unbalanced phases
 - Supplied via connection to the fuse terminals on the fusegear devices
 - Operational voltage: 400...690 V AC, $\pm 10\%$, 50/60 Hz.
- Tested for electromagnetic compatibility (EMC).
- Mounting:
 - Connected to the fuse-carrier assembly forming the cover.
- The package consists of:
 - A fuse-carrier/handle and fuse monitor sub-assembly supplied as a kit composed of:
 - Fuse monitor equipped with one NO contact and one NC contact
 - Fuse-carrier with the handle
 - The customer must remove his fuse-carrier/handle assembly from his product and replace it with this kit.
- Characteristics:
 - IP20 degree of protection
 - Product with fuse monitor must be integrated inside switchboards and not in front face in case of customers wants to have a complete class II insulation. Class II insulation with switchboard in front face is effective only when FuPacT ISFT is in closed position and with a door or a protection behind the fuse monitor.

Operation

Reset

The device is automatically reset when the fuse-links are replaced.

Indications

- Normal operation:
 - The green LED is ON when voltage is present at the fuse terminals
 - The contacts are in the rest position.
- Operation when a fuse blows:
 - The green LED goes off and the red LED goes on
 - The contacts are actuated:
 - The NO contact is for remote fault indication
 - The NC contact may be used, for example, to control an undervoltage device in order to shut down equipment that may be sensitive to single-phasing.

Insulation

FuPacT ISFT100N to ISFT630

Some accessories for insulation are used to prevent direct contact with the main circuits. For ISFT100, we have single and double escutcheon (with 1 free slot). These escutcheons, which could be used in combination, allow one type of cut-out on the front panel of switchboard. But in case of feeding busbars, The use of escutcheon is not compliant with feeding busbars. For ISFT100N and ISFT160 to 630, side profiles (or laterally attachable) provide vertical IP level across the door. The switchboard manufacturer must provide the horizontal IP. For those products, it's mandatory to use terminal shield when voltage is upper or equal to 500 V.

A

Insulation of live parts

Escutcheon

Clipped on the device, escutcheons provide IP20 and IK07 degrees of protection.

Type	Escutcheon type			Terminal shield

ISFT160

PB115846.eps

Control, locking and operation

FuPacT ISFT100N to ISFT630

The main moving contacts are controlled by the pivoting fuse-carrier assembly forming the cover for the ISFT devices. In open position, the fuse-switch disconnecter fuse-carrier assembly provides isolation with visible break.

A

ISFT100N.

ISFT400

Access to the fuse-links:

- May be provided by lead seals on the ISFT devices

To lock the fuse-switch disconnecter in closed (ON) position, the fuse-carrier is equipped as standard with a locking part.

Control

Locking

Lead-seal locking for the ISFT100N

Lead-seal locking for the ISFT100 to ISFT630 devices

Locking in open (OFF) position isolation as defined by IEC 60947-3.

Type	Function	Means	Accessory
ISFT100N	Device locking in closed (ON) position	Lead seal	Built-in
ISFT100			
ISFT160			
ISFT250 to ISFT630			

Functions and characteristics

Control, locking and operation

FuPacT ISFT100N to ISFT630

- For ISFT fusegear devices, the fuse-carrier cover is used both to control the device and to protect the fuse-link.
- ISFT100N: the pivoting fuse-carrier assembly accepts two fuse-links side by side and a third situated under the first two fuse-links.
 - ISFT100 to ISFT630: the pivoting fuse-carrier assembly accepts the three fuse-links side by side.

Fuse-carriers

Compatibility between ISFT fuse-switch disconnectors and fuse-links (NH)

Pivoting fuse-carrier assembly for the ISFT100N

Pivoting fuse-carrier assembly for the ISFT100 to ISFT630 devices

ISFT400	-	-	-	●	-
ISFT630	-	-	-	-	●

Insertion and removal of fuse-links

Fuse-links are held in place by clips behind the front panel of the fuse-carriers, thus making removal possible without touching the fuse-links.

Auxiliary contacts and indications

FuPacT ISFT100N to ISFT630

The optional auxiliary contacts carry out indication functions. They provide remote indication of the fuse-switch disconnecter status. They may also be used to indicate and carry out automatic functions such as electrical interlocking.

Standards: compliance with international recommendation IEC60947-5-1.
Description: NC/NO changeover contact.

Functional table of contact status

Auxiliary changeover contact		
		Maximum number

Reverse supply

FuPacT fusegear may be supplied equally well via the upstream or downstream terminals, without any reduction in performance.

Conductor materials and electrodynamic forces

FuPacT fusegear may be connected using either bare copper, tinned copper or tinned aluminium conductors (flexible or rigid bars, cables).
 In the event of a short-circuit, thermal and electrodynamic forces are exerted on the conductors. The conductors must therefore be adequately sized and suitably supported.
 Note that the terminals of electrical devices (switch-disconnectors, contactors, circuit breakers, etc.) should not be considered to contribute to the support of the conductors.

Cable ties and flexible bars

The table below indicates the maximum distances between cable ties depending on the prospective short-circuit current.
 Care must be taken not to exceed a distance of 400 mm between ties mechanically fixed to the switchboard frame.

Type of tie	"Panduit" type			"Sarel" type				
	Width: 4.5 mm			Width: 9 mm				
	Max. load: 22 kg			Max. load: 90 kg				
	Color: white			Color: black				
Max. distance between ties (mm)	200	100	50	350	200	100	70	50 (double ties)
Short-circuit current (kA rms)	10	15	20	20	27	35	45	100

Note: for cables $\geq 50 \text{ mm}^2$, 9 mm wide ties must be used.

Tightening torque for ISFT with screw connection

ISFL turnable hooks

PP107611_00mm.eps

B

With FuPacT ISFL, you have one of the most efficient vertical NH fuse switch-disconnectors ever designed with compact dimensions, a modular system and an elegant design. Your benefit are as follows:

Future proof

The trend is moving from simple power distribution stations to more intelligent power distribution stations. FuPacT ISFL is made for the future: with interfaces for measurement and control equipment which can be integrated in a space-saving manner.

Reduced heat development

Safeguarding high currents requires one thing above all: keeping a cool head. This is where FuPacT ISFL leads the pack. They feature one of the lowest heat development values of all products available on the market. This pays off for your entire facility: reduced energy loss, improved operating safety and durability.

Faster mounting

All installation and connecting components of the FuPacT ISFL were optimized and the number of assembling steps was reduced. This puts your switch "on the track" even more quickly.

Safety in mind

The switch gears are very user friendly and provide optimal user protection due to parallel switching. Two disconnected positions per phase produce two smaller electrical arcs. This causes only half the arc voltage.

Turnable contact hooks

FuPacT ISFL fuse-switches, vertical design, 00/60 are the first of its kind to feature turnable contact hooks. This makes it much easier to mount the NH Fuse-Switch on the busbar in addition to being much more flexible. Due to its symmetry, the NH Fuse-Switch can be turned around at any time. Terminal top or bottom can be chosen freely. Thus, only one version needs to be placed on stock.

Fast connection – with variable box terminals

High currents require large cable cross-sections. At the same time, modern switchboard cabinets are becoming more and more compact. They accommodate three cables of up to 95 mm² in the smallest possible. No one else can do that with a FuPacT ISFL 160 A. This is possible only due to the stepped and slightly offset arrangement of the box terminals. Captive screws enable a quick and reliable securing of the cable.

Optimized back-up with space-saving current-transformer installation

Do you wish to measure currents in addition to safeguarding them? We have redefined space for you. Our new current transformers can be installed behind the FuPacT ISFL, vertical design, without an alteration of installation depth. After removing the break-out-pieces from the socket, the current transformers is simply plugged on – ready for use. With or without a current transformer, the FuPacT ISFL always has the same installation depth, so no adaptors are required.

General characteristics: ISFL

FuPacT ISFL160 to ISFL1250

The elegant solution

To obtain the same installation depth with surrounding devices, the FuPacT ISFL vertical design, size 00/185 does not only come with conventional adapters but also features raised busbar connections. This makes it easy to mount the fuse-switch adjacent to devices of size 1 to 3. Simply hook the elevated feeding bracket onto the pre-mounted bolts or attach it with the contact hooks. There is no need for drilling. This allows the same installation depth for all sizes, giving the front face a clear uniform look.

No trouble with large cross-sections

Standard universal terminals allow the direct connection of cable lugs as well as cables with cross-sections up to 300 mm². Easy-to-install terminal hardware gives you great flexibility. No other small-sized FuPacT ISFL can do that.

Appealing at first sight

Rotating nameplates turn your installation possibilities into a real eye-catcher. No matter if the terminal is located on top or at the bottom, technical data and installation labels of all FuPacT ISFL are always correctly aligned.

Turn-off-position – up to three padlocks

Even fuse-protection-devices need to be protected: from electricity-theft, manipulation and unauthorized use. This is why every 3-pole FuPacT ISFL, vertical design, may be locked with up to three locks. This is possible in both, the closed and the secure padlock position.

Intelligent measurement

The future belongs to more intelligent switchboards. FuPacT ISFL is well prepared for the future: it offer standardized interface for measurement devices.

Contemporary power management

FuPacT ISFL measuring devices offers a large selection of measuring and monitoring options: from basic current measurements and power metering, harmonic wave analysis to remote management and alarm relays, and many more. All electrical parameters are visualized on an LCD and can be centralized. EM measuring devices are normally installed separately in the switchboard. FuPacT ISFL offer an integrated solution which can simply be plugged on.

Electronic Fuse-Monitoring - Everything under control

You know what happens and where it happens almost instantly to a notification, technician receives the information required to precisely locate and quickly correct short-circuits and overloads. Your technician will be faster to analyze and change fuse which is broken.

Condition of usage

It can only be used with $U < 690$ V AC.

FuPacT ISFL160 - 3 x 1P

FuPacT ISFL630 with fuse monitor

ISFL installation

FuPacT ISFL160

FuPacT ISFL fusegear is installed vertically and connected directly to the busbars. The connection is bolted or could be made by the hook-on connection.

B

PB115408_L32.eps

Direct connection to the busbars (ISFL160 and ISFL400)

ISFL160 fusegear

Connection to busbars.

The power circuit is connected:

- Directly to the 100 mm busbars for 3-pole version or to the 185 mm busbars for 1-pole version
 - Using a hook-on connection to 60 mm busbars (3-pole version)
 - Via a conversion kit for connection to 185 mm busbars (3-pole version)
 - Via a conversion kit for two devices and for connection to 185 mm busbars.
- Downstream connection of distribution circuits requires cables (3-pole version).

DB423385.eps

ISFL installation

FuPacT ISFL250 to ISFL1250

ISFL250/400/630 fusegear

Connection to busbars.

The power circuit is connected:

- Directly to the 185 mm busbars for 1-pole and 3-pole version
- Using a hook-on connection to 185 busbars

Direct connection to the busbars: the device is bolted to the busbars with one connection point per phase that allows for both electrical connection and robust mechanical mounting.

Hook-on connection to busbars: the device tightly hooks on to the busbars via three hooks that allows for both electrical connection and robust mechanical mounting.

These two systems allow for or enable direct contact of the power circuit to the busbars and usual connections for downstream distribution (bare cable connectors, lugs, bars, distribution connectors, etc.).

ISFL1250 fusegear

Connection to busbars.

The power circuit is connected:

- Directly to the 185 mm busbars for 3-pole version
- Using a hook-on connection to 185 mm busbars

The two connection systems can also be reversed to supply distribution circuits via the upstream terminals.

Connection and accessories

FuPacT ISFL160 to ISFL1250 - Connection

FuPacT ISFL fuse-switch disconnectors can supply distribution circuits via either the upstream or downstream terminals.
 Devices intended for connection to busbars are configured as standard for distribution via the downstream terminals.

ISFL fusegear is equipped with connectors or terminals for front connection of:

- Cables with lugs for the ISFL160 and ISFL1250 devices
- Flexible bars for the ISFL160 devices
- Bare cables for ISFL160 to 630 devices.

Direct connection on 185 mm busbar (ISFL160 with ISFL630)

B

ISFL160 fusegear devices with hook-on connection to 60 mm bars are available in two versions:

- Connection using M8 screws
- Connection using a 95 mm² terminal.

For each of these versions, the distribution reversal mode is achieved by rotating the hooks located at the rear, which gives the possibility of upstream distribution. The fuse-carrier assembly does not change position. All the various connection modes could be reversed also.

ISFL160 fusegear with turnable hooks [1]

ISFL250/400/630 fusegear [1]

ISFL160 release tab

- To remove the fuse-carrier assembly from the base, put the device in open position and press the release tab down.
- To lock the fuse-carrier assembly, replace it in open (OFF) position on the base and push the release tab up.

ISFL250/400/630 release tab

- To remove the fuse-carrier assembly from the base or install it on the base, check that the device is in open position and press the release tab down.
- To lock the device in open (OFF) position, push the release tab up.

[1] For ISFL 1-pole switchable: identical reversed distribution could be done.

Connection and accessories

Functions

The device provides remote indication of the standard fuse status (without strikers). It is used to:

- Signal a blown fuse
- Protect motors from overloads caused by single-phase operation.

Standards

- Compliance with international standard IEC 60947-5-1.
- Compliance with:
 - EN 50204
 - EN 61000 for electromagnetic compatibility (EMC).

Description

- Fuse monitor function only for 3P.
- Operation with DIN fuses.
- May be used on capacitor bank circuits.
- Simplified power supply:
 - Does not require a specific power supply
 - Operates with unbalanced phases
 - Supplied via connection to the fuse terminals on the switch-disconnector fuse
 - Operational voltage 400...690 V AC, ±10 %, 50/60 Hz.
- Tested for electromagnetic compatibility (EMC).
- ISFL160:
 - It is a fuse-carrier/handle and fuse monitor sub-assembly supplied as a kit composed of:
 - Fuse monitor equipped with one NO contact and one NC contact
 - Fuse-carrier with the handle
- ISFL250 to 1250:
 - Order directly the fuse monitor mounted on the product
- Characteristics:
 - IP20 degree of protection
 - To have a complete class II insulation, install the product with a fuse monitor inside a switchboard and not on the front face.

Class II insulation with switchboard on front face is ensured only when FuPacT ISFL is in closed position.

Note: lugs for connection to the fuse-carrier are not supplied.

Operation

Reset

The device is automatically reset when the fuse-links are replaced.

Indications

- Normal operation:
 - The green LED is ON when voltage is present at the fuse terminals
 - The contacts are in the rest position
- Operation when a fuse is blown:
 - The green LED goes off and the red LED goes on
 - The contacts are actuated:
 - The NO contact is for remote fault indication
 - The NC contact may be used, for example, to control an undervoltage device in order to shut down equipment that may be sensitive to single-phasing.

Measurement accessory

FuPacT ISFL160 to ISFL1250

The current transformers (CTs) produce a current (1 - 5 A) on the secondary winding that is proportional to the current measured on the primary winding. They can therefore be used in conjunction with measurement devices (ammeters, energy meters), load-shedding devices, control relays, etc.

Single block current transformer for ISFL160 (1 or 3 CTs)

Current transformer for ISFL160 (1-pole version)

Current transformer for ISFL250/400/630/1250

Altitude correction factor with CT module

2000m	$I_e/I_n = 1$
3000m	$I_e/I_n = 0.98$
4000m	$I_e/I_n = 0.96$
5000m	$I_e/I_n = 0.94$

Diversity factor with CT module

number of main circuit	rated diversity factor
2 and 3	0.9
4 and 5	0.8
6 to 9 inclusive	0.7
10 (and more)	0.6

Ambient derating factor with CT module

ambient temperature	de-rating factor
40°C	1.0
45°C	0.95
50°C	0.9
55°C	0.85
60°C	0.8
65°C	0.75
70°C	0.7

Operation and implementation

FuPacT ISFL160 to 1250 fusegear can be equipped with tube-unit current transformers (CT).

CT modules are available in two versions:

- 3-pole module with one or three CTs for ISFL160 fusegear (3-pole version), 1 rating 150 A.
- Single-pole module with one CT for ISFL160 (1-pole version) /250/400/630/1250.
- Fusegear, 4 ratings from 150 to 600 A.

The CT modules are clipped onto the back of the switchgear.

The modules can be connected:

- Via terminal blocks for the 3-pole modules (ISFL160) with output current of 1 A.
- Via cables directly connected with output current of 5 A.
- Via lugs for the single-pole modules (ISFL 160 (1 pole version)/250/400/630/1250).

Selection table

ISFL160 class 1 1-pole version

$I_p/5$	$I_p/1$	Power (VA)
150/5	-	5

ISFL160 accuracy class 1 3-pole version

$I_p/5$	$I_p/1$	Power (VA)
150/5	-	1.5
	150/1	2.5

ISFL250 to 1250 class 1 1 and 3-pole version

$I_p/5$	Power (VA)
150/5	2.5
250/5	5
400/5	5
600/5	5

Environment

- Compliance with standards: IEC 60044-1, NFC 42502, VDE 0414, BS 7626 and IEC 60038-1.
- Degree of protection: IP20.
- Operating temperature range: -25 °C to +70 °C, relative humidity 95 %.
- Storage temperature range: -40 °C to +80 °C.

Technical characteristics

CT electrical characteristics:

- Maximum operational voltage: 800 V
- Secondary current: 5 A and 1 A
- Frequency: 50 to 60 Hz
- Continuous overload current: 1.2 I_n
- Safety factor: $F_s \leq 5$.

Transformation ratio:

- $I_p/5$ A.

Select the ratio just above the measured current (I_n).

Example: $I_n = 550$ A → select a ratio of 600/5.

CT accuracy class:

- The accuracy class depends on the transformer rating and the consumption of the measurement system. Consumption must take into account the devices and cables
- For a given accuracy class, measurement system consumption must not exceed the transformer rating.

Reminder:

Transformer secondary must be short-circuited before any work.

Measurement accessory FuPacT ISFL160 to ISFL1250

CT accuracy class

Measurement system	
Schneider Electric device	Consumption in VA
72 x 72 mm ammeter	1.1
Analogue ammeter	1.1
Digital IM ammeter	0.5
Digital ammeter	0.3
PM/CM Power Meter	0.15
PM9	0.55

Primary copper cross-section in mm ²	Rating in VA per meter of double wire at 20 °C
1	1
1.5	0.685
2.5	0.41
4	0.254
6	0.169
10	0.0975

For each ten-degree increase in temperature, the power drawn by the cables increases by 4 %.

Example of measurement system consumption at 40 °C

4 m of 2.5 mm ² double wire	1.7 VA
PM	+ 0.15 VA
Total consumption	= 1.85 VA

CT accuracy class

The accuracy class of the CT is determined:

- Using the selection table
- By the fact that consumption must be < the transformer rating:
 - Class 1 for a CT with a ratio of 150/5
 - Class 0.5 for a CT with a ratio of 200/5.

If measurement accuracy must be within 0.5 %, it is necessary to select a CT with a transformation ratio of 200/5.

ISFL250 (with CT)

Fuse-link monitoring and testing

FuPacT ISFL160 to ISFL1250

B

PB107611_30_eps

ISFL160

Monitoring

ISFL fuse-switch disconnecters are equipped with large windows so that the fuse-link technical characteristics are clearly visible.

DB423419_eps

Testing

DB423420_eps

Sliding covers on the front panel provide access to the fuse-link status test points while maintaining the IP20 protection index.

Note: monitoring and testing functions are the same for ISFL 1 pole switchable.

Control, locking and operation

FuPacT ISFL160 to ISFL1250

The main moving contacts are controlled by the drawout fuse-carrier assembly for the ISFL devices. In open position, the fuse-switch disconnecter fuse-carrier assembly provides isolation with visible break.

Control

Removed sub-assembly [1]

ISFL160

To indicate isolation at a glance during maintenance operations for example, put the ISFL fuse switch-disconnector in the "PARK" position by pressing the lock on the front of the **product**.

In this position, the handle is free and the fuses are physically separated from the contacts.

The **product** can then be padlocked (3 x Ø6 mm padlocks for ISFL160 and Ø8 mm for other ISFL).

Press the lock again to close the product when the padlocks have been removed. Another solution is to remove the upper sub-assembly by pressing the lock in the "OUT" position. **Then**, the sub-assembly must be reversed and put directly on the product.

Access to the fuse-links:

- Is automatically blocked on the ISFL devices when the fusegear is closed
- May be restricted using padlocks on the ISFL devices.

To lock the fuse-switch disconnecter in closed (ON) or open (OFF) position, the fuse-carrier is equipped with lead-seal or padlocking accessories (not supplied).

Locking ON [2]

Locking OFF [2]

Padlocking for the ISFL160 to ISFL630 devices

[2] Except for ISFL160 - 1P to ISFL630 - 1P.

Locking in open (OFF) position provides isolation as defined by IEC 60947-3.

Type	Function	Means	Accessory
ISFL160	Device locking in closed (ON) or open (OFF) position	Padlocks 3 max Ø6	Built-in
ISFL250 to ISFL1250		Padlocks 3 max Ø8	

Control, locking and operation

FuPacT ISFL160 to ISFL1250

For FuPacT ISFL fusegear devices, the fuse-carrier assembly is used both to control the device and to mechanically protect the fuse-link.

B

ISFL160

Fuse-carriers ^[1]

Compatibility between ISFL fuse-switch disconnectors and fuse-links (NH)

Drawout fuse-carrier assembly for the ISFL 160 to 1250 devices

Type of DIN fuse-link	NH000	NH00	NH1	NH2	NH3
ISFL160	●	●	-	-	-
ISFL250	-	-	●	-	-
ISFL400	-	-	-	●	-
ISFL630	-	-	-	-	●
ISFL1250	-	-	-	-	●

Insertion and removal of fuse-links

Fuse-links are held in place by clips behind the front panel of the fuse-carriers, thus making removal possible without touching the fuse-links.

ISFL 160 and ISFL250 to ISFL1250

[1] Control, locking and operation are the same for ISFL 1-pole switchable.

Auxiliary contacts and indications

FuPacT ISFL160 to ISFL1250

The optional auxiliary contacts carry out indication functions. They provide remote indication of the fuse-switch disconnecter status. They may also be used to indicate and carry out automatic functions such as electrical interlocking.

Standards: compliance with international recommendation IEC60947-5-1.
Description: NC/NO changeover contact.

Functional table of contact status

Auxiliary changeover contact		
		Maximum number
ISFL160		2
ISFL250		4

ISFL250-630 + Empty box with power meter

The future belongs to more intelligent switchboards. The new ISFL generation, vertical design, are well prepared for the future: they offer standardized interfaces for all types of measurement devices.

Schneider Electric is offering a complete and large offer of metering devices: PowerLogic range.

PowerLogic series meter - Power Meter

The Power Meter serie offers many high-performance capabilities needed to meter and monitor an electrical installation in a compact unit.

All models include an easy-to-read display that presents measurements for all three phases and neutral at the same time, total harmonic distortion (THD) metering, and alarming.

Some models offer an incremental choice of custom logging and power quality analysis capabilities.

Expand any model with field-installable option modules that offer a choice of additional digital inputs and outputs, analog inputs and outputs, and ethernet port.

Flexible measurement options - the amperemeter

Additional measurement options are possible using an amperemeter which is adjusted onto the new amperemeter-bracket. The installation is incredibly simple and the returns extremely versatile.

How to install device

- For ISFL160, you can use an empty box to include measurement device:
 - Plastic box
 - Dimension 46 x 46 mm for the cut-out
 - Length: the same as the length adaptor to be able to put the ISFL160 beside ISFL250 to ISFL630
 - Fixation by mounting it directly to the top of the product.
- For ISFL250 to 630, you can use empty boxes to include measurement devices:
 - Plastic box
 - Dimension 72 x 72 mm and 96 x 96 mm for the cut-out
 - Fixation by mounting it directly to the top of the product.

Implementation and power dissipation

FuPacT ISFL

B

Reverse supply

FuPacT fusegear may be supplied equally well via the upstream or downstream terminals, without any reduction in performance.

Conductor materials and electrodynamic forces

FuPacT fusegear may be connected using either bare copper, tinned copper or tinned aluminium conductors (flexible or rigid bars, cables).

In the event of a short-circuit, thermal and electrodynamic forces are exerted on the conductors. The conductors must therefore be adequately sized and suitably supported.

Note that the terminals of electrical devices (switch-disconnectors, contactors, circuit breakers, etc.) should not be considered to contribute to the support of the conductors.

Cable ties and flexible bars

The table below indicates the maximum distances between cable ties depending on the prospective short-circuit current.

Do not to exceed a distance of 400 mm between ties strongly fixed to the switchboard frame.

Type of tie	"Panduit" type			"Sarel" type				
	Width: 4.5 mm Max. load: 22 kg Color: white			Width: 9 mm Max. load: 90 kg Color: black				
Max. distance between ties (mm)	200	100	50	350	200	100	70	50 (double ties)
Short-circuit current (kA rms)	10	15	20	20	27	35	45	100

Note: for cables $\geq 50 \text{ mm}^2$, 9 mm wide ties must be used.

Tightening torque for ISFL with screw connection

	Type	Torque (Nm)
ISFL	ISFL160 1-pole version with direct connection to 185 mm busbars	14
	ISFL160 1-pole version with hook-on connection to 185 mm busbars	14

Extended lateral handles, red handle on yellow front

Functions

The FuPacT GSB32 and GSC32 switch disconnecter fuses are used with fuses that protect electrical circuits against overloading and short circuits.

They provide a circuit cut-off function by means of a double break upstream and downstream of the fuses.

They also provide a switch function allowing circuits to be cut-off when under load.

Format and installation

The FuPacT GSC32 and GSB32 devices are compact and monobloc (96 mm wide), thereby optimizing the space used.

The dimensions of the 3- and 4-pole devices are identical.

The devices are installed either on a DIN rail or by means of mounting screws on a plate. The mounting points are incorporated into the products. There is no need to add accessories to fasten the products to a plate.

Number of poles

The devices are available as 3- or 4-pole versions cut-off by the open/close control. The 3P devices are fitted with 3 fuse holders, cut-off upstream and downstream of the fuse.

The 4P devices are fitted with 3 fuse holders, cut-off upstream and downstream of the fuse and a neutral connection, cut-off, UNPROTECTED.

Controlling the devices

■ The devices can be controlled in three ways:

- By direct control using reference GS1AH103. This control is fitted directly to the device.
- By extended frontal control with a handle installed on the door of the electrical cabinet.
- By extended lateral control with a handle installed on the side of the electrical cabinet.

■ The control rods are available in 3 lengths: 200 , 320 or 400 m.

Note: They must be ordered separately.

■ Several types of IP65 control handle are available and must be ordered separately

- For frontal installation, black or yellow/red with or without test position
- For lateral installation, black or yellow/red without test position

■ The front handles allow the door to be interlocked with the control rod of the device. This prevents the opening of the door cabinet if the device is in the ON position.

■ The lateral controls do not allow the door and the control rod to be interlocked. They must not be used as a frontal control.

Lockout system

The function whereby the devices can be locked in the OFF position is available on the direct control handle and the extended control handles.

It allows up to 3 padlocks to be fitted on each handle.

Using the devices as emergency switch disconnecter fuse

The FuPacT switch disconnecter fuse can be used as emergency cut-off devices.

For this application, they must be easily visible, accessible and identifiable (see standards and rules: VDE 0660, VDE 0113, CNOMO, etc.).

For the purposes of easy identification, the emergency cut-off switch disconnectors fuse use special colors, as stipulated by the standards and different from those of the standard version:

- Yellow for the front face of the device or the control plate
- Red for the handle.

The performance characteristics of the FuPacT emergency cut-off switch disconnecter fuse are the same as those of the standard version.

Presentation of the FuPacT GS range

FuPacT GSB and GSC 32

Connecting the devices

The FuPacT GSC32 and GSB32 devices are fitted with screw terminals which can accommodate conductors of 2.5 to 16 mm² cross section.

Fuse type and installation

- GSC 32 supports NF 10*38 cylindrical fuses compliant with IEC60269/NFC63320 standards.
- GSB 32 supports BS A1 fuses compliant with IEC60269/BS88 standards.

Note: The fuses are not supplied with the devices.

- For GSC 32, the fuses are installed in the cover, opened prior to installation.
- For GSB 32, the fuses are installed in the device on the mountings provided for this purpose. Manual tightening is strongly advised in order to comply with the recommended tightening torques (consult the instruction sheet).

Cone guide

This accessory allows the control rod to be re-centred with regard to the hole drilled in the door. It is fitted to the door and serves to offset a drilling discrepancy or a bowing of the long rods of ±10 mm

Auxiliary contacts/Pre cut-off

The GSC32 and GSB32 devices can be fitted with 4 auxiliary contacts enabling the mechanical position of the device to be indicated. 2 auxiliary contacts are fitted directly to the device (see manual) and 2 others can be stacked on top of the first ones.

The NO or NC auxiliary contacts thus allow the ON, OFF and TEST positions of the device to be indicated.

The TEST position is indicated if a handle WITH TEST position is used.

The auxiliary contacts also serve to indicate the pre cut-off of the device, as soon as the handle is activated but before the poles are opened.

This allows a charge to be stopped before cutting the main power supply.

- References GS1AM110 and GS1AM101 have 1 auxiliary contact (NO or NC) + 2 plastic tappets.
- References ZBE101 and ZBE102 are the auxiliary contacts alone.

Functions

The FuPacT GSC50, GSB63 and GSD63 switch disconnecter fuses are used with fuses that protect electrical circuits against overloading and short circuits.

They provide a circuit cut-off function by means of a double break upstream and downstream of the fuses.

They also provide a switch function allowing circuits to be cut-off when under load.

Format and installation

The FuPacT GSC 50, GSD 63 and GSB 63 devices are compact, optimizing the space used. They consist of poles assembled and tested in factory as well as a housing for the control mechanism.

The transparent covers make it possible to see the presence or absence of fuses and their rating.

The devices are installed either on a DIN rail or by means of mounting screws on a plate. The mounting points are incorporated into the products. There is no need to add accessories to fasten the products to a plate.

Number of poles

The devices are available as 3- or 4-pole versions cut-off by the open/close control. The 3P devices are fitted with 3 fuse holders, cut-off upstream and downstream of the fuse.

The 4P devices are fitted with 4 fuse holders, cut-off upstream and downstream of the fuse. One of the poles may be fitted with a neutral link (see internal neutral links).

Controlling the devices

- The devices can be controlled in three ways:
 - By direct control using reference LV481701. This control is fitted directly to the housing of the device control mechanism.
 - By extended frontal control with a handle installed on the door of the electrical cabinet.
 - By extended lateral control with a handle installed on the side of the electrical cabinet.

- The control rods are available in 3 lengths: 200, 320 or 400 mm.

Note: They must be ordered separately.

- Several types of IP65 control handle are available and must be ordered separately.
 - In the event of frontal installation, black or yellow/red, with or without test position.
 - For lateral installation, black or yellow/red, without test position.

- The front handles allow the door to be interlocked with the control rod of the device. This prevents the opening of the door cabinet if the device is in the ON position.

- The lateral controls do not allow the door and the control rod to be interlocked. They must not be used as a frontal control.

Lockout system

The function whereby the devices can be locked in the OFF position is available on the direct control handle and the extended control handles.

It allows up to 3 padlocks to be fitted on each handle.

It is also possible to padlock the devices directly, either on the control unit using a single padlock or a multi-padlock lockout accessory or on the lockout tab located on the lower face of the control unit. This can accommodate up to 3 padlocks.

Using the devices as emergency switch disconnecter fuse

The FuPacT switch disconnecter fuse can be used as emergency cut-off devices.

For this application, they must be easily visible, accessible and identifiable (see standards and rules: VDE 0660, VDE 0113, CNOMO, etc.).

For the purposes of easy identification, the emergency cut-off switch disconnecter fuse use special colors, as stipulated by the standards and different from those of the standard version:

- Yellow for the front face of the device or the control plate
- Red for the handle.

The performance characteristics of the FuPacT emergency cut-off switch disconnecter fuse are the same as those of the standard version.

Presentation of the FuPacT GS range

FuPacT GSC 50, GSB and GSD 63

Connecting the devices

The FuPacT GSC 50, GSD 63 and GSB 63 devices are fitted with screw terminals which can accommodate conductors of:

- 10 to 25 mm² for the GSC 50
- 16 to 25 mm² for the GSD 63 and GSB 63.

Fuse type and installation

- GSC 50 supports NF 14*51 cylindrical fuses compliant with IEC60269/NFC63320 standards
- GSD 63 supports DIN 000 fuses compliant with IEC60269/NFC63320 standards
- GSB 63 supports BS A2 and A3 fuses compliant with IEC60269/BS88 standards

Note: The fuses are not supplied with the devices.

- For GSC 50 and GSD 63, the fuses are installed by rotating the transparent protective cover, with the power supply switched off, then inserting the fuses in the fuse holders.
- For GSB 63, the fuses are installed by removing the transparent protective cover, with the power supply switched off, then installing the fuses on the mounting provided for this purpose. Manual tightening is strongly advised in order to comply with the recommended tightening torques (consult the device manual).

External neutral module and internal neutral link

The NFC 50A and DIN 63A (LV481911 and LV481913) neutral links create a neutral connection in the device. The links are fitted instead of a fuse.

The external neutral modules are poles fitted with a removable neutral connection which is NOT CUT (no mechanism).

They are installed directly on the left-hand side of the product on the 3-pole device.

Cone guide

This accessory allows the control rod to be re-centred with regard to the hole drilled in the door. It is fitted to the door and serves to offset a drilling discrepancy or a bowing of the long rods of ±10 mm.

Auxiliary contacts / Pre cut-off

The FuPacT GSC 50, GSB 63 and GSD 63 devices can be fitted with 4 auxiliary contacts enabling the mechanical position of the device to be indicated. 2 auxiliary contacts are fitted directly to the device (see manual) and 2 others can be stacked on top of the first ones.

The NO or NC auxiliary contacts thus allow the ON, OFF and TEST positions of the device to be indicated

The TEST position is indicated if a handle WITH TEST position is used

The auxiliary contacts also serve to indicate the pre cut-off of the device, as soon as the handle is activated but before the poles are opened.

This allows a charge to be stopped before cutting the main power supply.

- References GS1AM110 and GS1AM101 have 1 auxiliary contact (NO or NC) + 2 plastic tappets.
- References ZBE101 and ZBE102 are the auxiliary contacts alone.

- FuPacT GSD and GSB 400: LV481203 (set of 3) or LV481204 (set of 4).

In order to protect the direct contact connections, terminal covers may be used.

For FuPacT GSB 200, GSD and GSB 250, GSD and GSB 400:

- GS1AP43 (set of 3)
- GS1AP44 (set of 4)

Fuse type and installation

- GSB 200 supports BS B1 and B2 fuses compliant with IEC60269/BS88 standards.
- GSD 250 supports DIN 1 fuses compliant with IEC60269/NFC63320 standards.
- GSB 250 supports BS B1, B2 and B3 fuses compliant with IEC60269/BS88 standards.
- GSD 400 supports DIN 2 fuses compliant with IEC60269/NFC63320 standards.
- The GSB 400 support BS B1, B2, B3 and B4 fuses compliant with IEC60269/BS88 standards.

Note: The fuses are not supplied with the devices.

- For all FuPacT GSD 250 and GSD 400, the fuses are installed by rotating the transparent protective cover, with the power supply switched off, then inserting the fuses in the fuse holders.
- For the FuPacT GSB 200, GSB 250 and GSB 400, the fuses are installed by rotating the transparent protective cover, with the power supply switched off, then installing the fuses in the housings provided for this purpose. Manual tightening is strongly advised in order to comply with the recommended tightening torques (consult the device manual).

External neutral module and internal neutral link

The DIN 250 and DIN 400A (LV481915 and LV481916) neutral links create a neutral connection in the device. The links are fitted instead of a fuse.

The external neutral modules are poles fitted with a removable neutral connection which is NOT CUT (no mechanism).

They are installed directly on the left-hand side of the product on the 3-pole device.

Cone guide

This accessory allows the control rod to be re-centred with regard to the hole drilled in the door. It is fitted to the door and serves to offset a drilling discrepancy or a bowing of the long rods of ± 10 mm.

Auxiliary contacts / Pre cut-off

The FuPacT GSB 200, GSD and GSB 250, GSD and GSB 400 devices can be fitted with 8 auxiliary contacts enabling the mechanical position of the device to be indicated. 4 auxiliary contacts are fitted directly to the device (see manual) and 4 others can be stacked on top of the first ones.

Note: if using an LV481702 direct control fitted with its auxiliary contacts protective cover, the number of contacts that can be used is reduced to 4.

The NO or NC auxiliary contacts thus allow the ON, OFF and TEST positions of the device to be indicated.

The TEST position is indicated if a handle WITH TEST position is used

The auxiliary contacts also serve to indicate the pre cut-off of the device, as soon as the handle is activated but before the poles are opened.

This allows a charge to be stopped before cutting the main power supply.

- References GS1AM110 and GS1AM101 have 1 auxiliary contact (NO or NC) + 2 plastic tappets.

Detailed presentation

Presentation of the FuPacT GS range

FuPacT GSB and GSD 1250

FuPacT GSB 1250

Functions

The FuPacT GSD and GSB 1250 A switch disconnecter fuses are used with fuses that protect electrical circuits against overloading and short circuits.

They provide a circuit cut-off function by means of a double break upstream and downstream of the fuses.

They also provide a switch function allowing circuits to be cut-off when under load.

Format and installation

The GSD and GSB 1250 A devices are compact, optimizing the space used.

They consist of poles assembled and tested in factory as well as a housing for the control mechanism

The transparent covers make it possible to see the presence or absence of fuses and their rating

The devices are installed on a plate. The mounting points are incorporated into the products. There is no need to add accessories to fasten the products to a plate.

Note: The weight of the devices may require the intervention of 2 people when installing on a plate.

Number of poles

The devices are available as 3- or 4-pole versions cut-off by the open/close control.

The 3P devices are fitted with 3 fuse holders, cut-off upstream and downstream of the fuse.

The 4P devices are fitted with 4 fuse holders, cut-off upstream and downstream of the fuse. One of the poles may be fitted with a neutral bar.

Controlling the devices

■ The devices can be controlled in two ways:

- By extended frontal control with a handle installed on the door of the electrical cabinet.
- By extended lateral control with a handle installed on the side of the electrical cabinet.

■ The control rods are available in 3 lengths: 200, 320 or 400 m.

Note: They must be ordered separately.

■ Several types of IP65 control handle are available and must be ordered separately

- For frontal installation, black or yellow/red without test position
- For lateral installation, black or yellow/red without test position

■ The frontal handles for the FuPacT GSD and GSB 1250 A devices are relatively wide dual-branch handles. Remember to provide for an installation allowing the control to be activated easily.

■ The front handles allow the door to be interlocked with the control rod of the device. This prevents the opening of the door cabinet if the device is in the ON position.

■ The lateral controls do not allow the door and the control rod to be interlocked. They must not be used as a frontal control.

Lockout system

The function whereby the devices can be locked in the OFF position is available on the direct control handle and the extended control handles.

It allows up to 3 padlocks to be fitted on each handle.

It is also possible to padlock the devices on the control unit directly using the padlocking lug accessible on the front panel of the control unit. This lug can accommodate up to 3 padlocks.

Using the devices as emergency switch disconnecter fuse

The FuPacT switch disconnecters fuse can be used as emergency cut-off devices.

For this application, they must be easily visible, accessible and identifiable (see standards and rules: VDE 0660, VDE 0113, CNOMO, etc.).

For the purposes of easy identification, the emergency cut-off switch disconnecter fuse use special colors, as stipulated by the standards and different from those of the standard version:

- Yellow for the front face of the device or the control plate
- Red for the handle.

The performance characteristics of the FuPacT emergency cut-off switch disconnecter fuse are the same as those of the standard version.

The FuPacT GSD and GSB 1250 A devices are fitted with tin-plated terminal to connect directly conductors fitted with cable lugs or bars.

To facilitate rear connections, the connection terminal can be rotated.

In order to protect connections from direct contact, terminal covers may be used.

For FuPacT GSD and GSB 1250 A:

- GS2AP83 (set of 3)
- GS2AP84 (set of 4).

Fuse type and installation

- The GSD 1250 supports DIN 4 fuses compliant with IEC60269/NFC63320 standards
- The GSB 1250 devices support BS D1 fuses compliant with IEC60269/BS88 standards.

Note: The fuses are not supplied with the devices.

- For FuPacT GSD 1250, the fuses are installed by rotating the transparent protective cover, with the power supply switched off, then inserting the fuses in the fuse holders. The fuse holder terminal must be tightened for correct installation of the fuses
- For FuPacT GSB 1250, the fuses are installed by rotating the transparent protective cover, with the power supply switched off, then installing the fuses in the housings provided for this purpose. Manual tightening is strongly advised in order to comply with the recommended tightening torques (consult the device manual).

External neutral module and internal neutral link

The DIN 1250A (LV481918) neutral links create a neutral connection in the device. The links are fitted instead of a fuse.

The external neutral modules are poles fitted with a removable neutral connection which is NOT CUT (no mechanism).

They are installed directly on the left-hand side of the product on the 3-pole device.

Cone guide

This accessory allows the control rod to be re-centred with regard to the hole drilled in the door. It is fitted to the door and serves to offset a drilling discrepancy or a bowing of the long rods of ± 10 mm.

Auxiliary contacts / Pre cut-off

FuPacT GSD and GSB 1250A devices can be fitted with 8 auxiliary contacts enabling the mechanical position of the device to be indicated.

4 auxiliary contacts are fitted directly to the device (see manual) and 4 others can be stacked on top of the first ones.

The NO or NC auxiliary contacts thus allow the ON and OFF positions of the device to be indicated

The auxiliary contacts also serve to indicate the pre cut-off of the device, as soon as the handle is activated but before the poles are opened.

This allows a charge to be stopped before cutting the main power supply.

- References GS1AM110 and GS1AM101 have 1 auxiliary contact (NO or NC) + 2 plastic tappets.
- References ZBE101 and ZBE102 are the auxiliary contacts alone.
