# I/O Modernization

## Quantum to X80 I/O Modernization

The X80 Automation Series supports a full range of high performance I/O modules designed to interface with a wide variety of field devices. Schneider Electric Services offers a series of Evolution products to ease the migration from Quantum I/O to X80 I/O.

### **⚠ WARNING**

#### **RISK OF UNINTENDED OPERATION**

X80 I/O analog modules come with default factory software settings. Failure to configure these settings to match the settings of the Quantum module being replaced can lead to unintended system operation.

**Failure to follow these instructions can result in death, serious injury, or equipment damage.**

**NOTE:** Analog modules require configuration parameters to be set that replicate the functionality of the Quantum module being replaced. For additional information refer to the publication *Modicon X80 Analog Input/Output Modules User Manual* (Document Number 35011978).

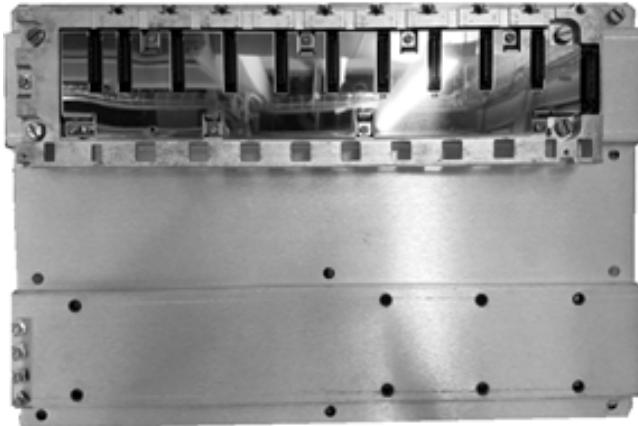

There are two different Quantum to X80 modernization mounting solutions available in the Evolution offer, the Mounting Plate and the Chassis Assembly.

Their use is independent of each other, the Quantum system hardware makeup will determine which solution can be used.

## Mounting Plate Solution

The Quantum to X80 PLC-I/O Mounting Plate (Figure 1) is an aluminum plate that looks very similar to the Quantum Backplane (minus the backplane PCB). It is compatible with the existing Quantum System footprint and mounting hole pattern. The mounting plate is available in 6, 10, and 16 slot backplane sizes.

Figure 1 displays a mounting plate with one X80 backplane installed in the upper position. A second X80 backplane can be mounted in the lower position.

**Figure 1:**

**NOTE:** The X80 backplanes are not included as part of the Evolution PLC-I/O Mounting Plate. You will need to determine the proper size and type of backplanes your application requires, then add the part number(s) and quantities to your Bill of Materials.

Refer to the list of Evolution Backplane Mounting Plate part numbers, page 31.

The mounting plate is used in cases where the wiring adapters are not desired. This includes:

- When there are no I/O modules in the existing Quantum Chassis, for example a local drop with only a CPU, power supply and communication modules.
- When there is sufficient time to rewire the Quantum I/O terminal blocks to the new X80 terminal blocks and then test the design.
- When the existing Quantum system uses Cablefast interposing terminal blocks.
- When the existing Quantum chassis uses only 96 point I/O modules, which enable the use of the 990ADQUAX80246 front mounted adapter assembly.

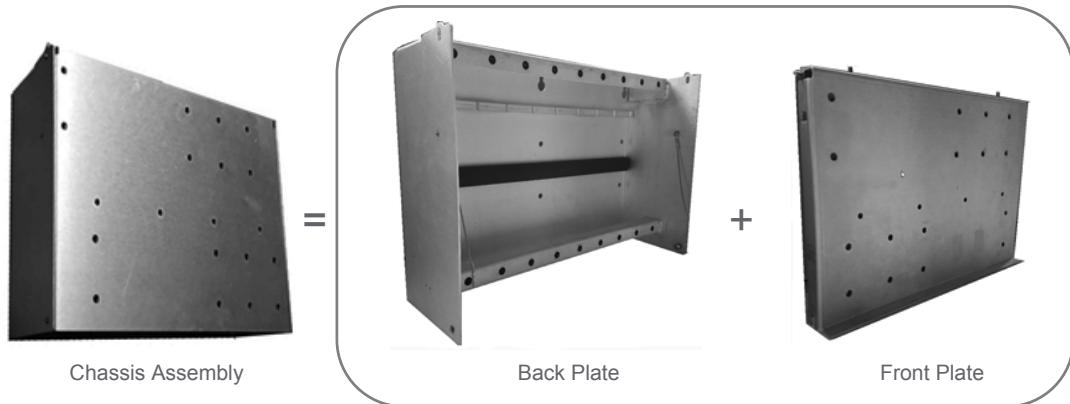

The mounting plate is not designed to be used with I/O adapter assemblies. If I/O Adapter Assemblies are required, use the Chassis assembly.

For additional information reference document Quantum to X80 Backplane Mounting Plate Installation Guide (MFR38561).

## Chassis Assembly Solution

The Quantum to X80 PLC-I/O Chassis (Figure 2) consists of a back plate and a front plate. This assembly is designed to fit on the same footprint, and use the same mounting hardware, as the Quantum backplane. The assembly is made of aluminum and is available in sizes that match Quantum 6, 10, and 16 slot backplane sizes.

**Figure 2:**

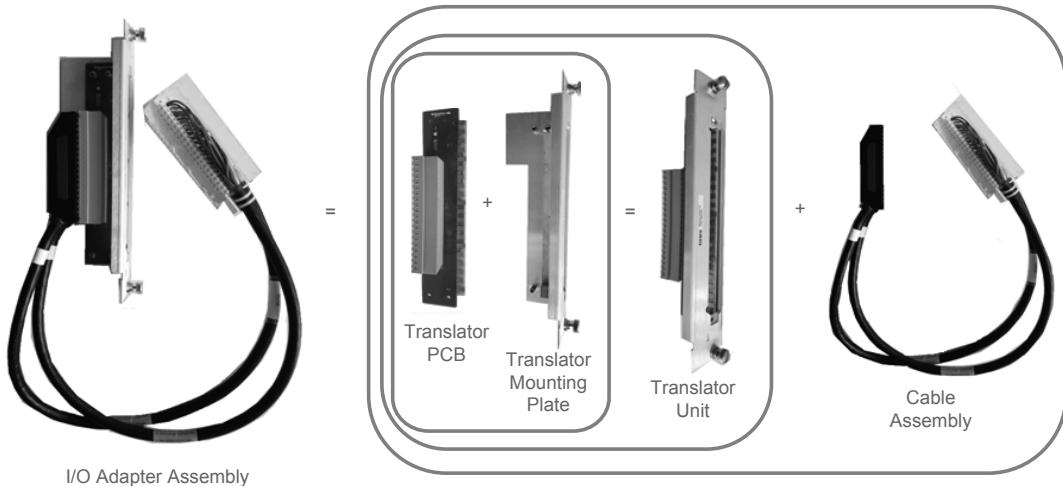

**NOTE:** The X80 backplanes are not included as part of the Evolution PLC-I/O Chassis assembly. You will need to determine the proper size and type of backplanes your application requires, then add the part number(s) and quantities to your Bill of Materials.

Refer to the list of Quantum to X80 PLC-I/O Chassis part numbers, page 29.

## Adapter Components

The Evolution I/O adapter assembly offer consists of a translator unit and cables to route the field wiring from the Quantum field connector to the X80 I/O module. The parts that make up the I/O adapter assembly are shown in Figure 3, below:

**Figure 3:**

## Mounting Products

The following types of Evolution adapter assemblies are available for mounting the new X80 I/O modules:

- Dedicated I/O adapter: The translator PCB performs the wiring translations from the Quantum field connector pins to the X80 field connector pins. These assemblies use the dedicated cables (X80 connector wired to the cable). (Figure 4)
- Generic I/O adapter: The translator PCB does not perform the wiring translation from the Quantum connector pins to the X80 field connector pins. These adapters use pigtail cables, which require wiring to the X80 connector (supplied). (Figure 5)

**NOTE:** Installers of generic I/O adapters are strongly advised to pre-wire and test each generic I/O adapter before entering the site where the adapter is to be installed. In the absence of pre-wiring, you may experience unwanted delay in completing the task of mounting the X80 I/O modules.

- Front Mount I/O adapter: This style of adapter does not mount within the chassis assembly. These adapter assemblies connect directly to X80 modules that use the 40-pin FCN connector.(Figure 6)

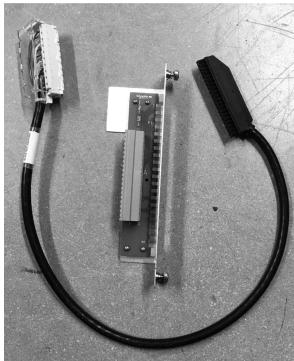

## ⚠ CAUTION

### LOSS OF INPUT/OUTPUT FUNCTION

Generic I/O adapters do not contain fuses or other measures to help protect against external events, such as circuit overload, short circuit, or sensor/pre-actuator voltage errors. Confirm that sufficient module protection measures are in place. Refer to the *Modicon X80 Discrete Input/Output Modules User Manual* (35012474) for details regarding X80 module external protection recommendations.

**Failure to follow these instructions can result in injury or equipment damage.**

**Figure 4 (dedicated I/O adapter):**

**Figure 5 (generic I/O adapter):**

**Figure 6 (front mount I/O adapter):**

All of these assemblies let you connect the existing Quantum field wiring to X80 I/O, without altering existing field wiring connections.

## Safety Precautions

### ⚠ DANGER

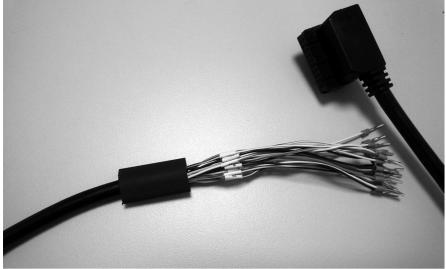

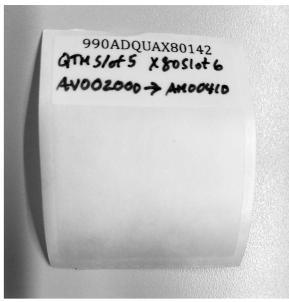

#### HAZARD OF ELECTRIC SHOCK, EXPLOSION OR ARC FLASH

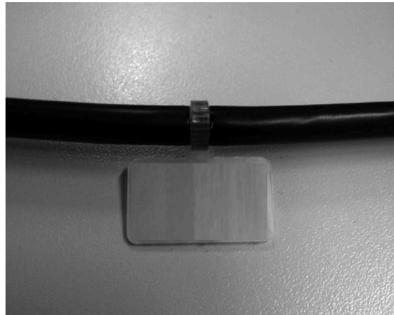

- Apply appropriate personal protective equipment (PPE) and follow safe electrical work practices. Follow local electrical codes and standards.
- Turn OFF all power before working on or inside equipment.
- Always use a properly rated voltage sensing device to confirm that power is OFF.

**Failure to follow these instructions will result in death or serious injury.**

## Assembling Cables

If you are using a generic I/O adapter in the modernization, assemble all of these cables (using the appropriate wiring guide) before beginning the modernization:

| Step | Action   |  |
|------|--|--|
| 1    | Before wiring the X80 connector to the cable, place the supplied shrink tube over the cable (Figure 7).  | <p><b>Figure 7:</b></p>    |
| 2    | Connect the cable wires to the X80 connector as indicated in the appropriate wiring guide. After all wiring is completed, Schneider Electric recommends that you trim back the unused wires at the outer jacket.   |  |
| 3    | After the X80 connector wiring is completed, shrink the tubing over the end of the cable jacket and wires. Then secure the cable to the connector with the supplied tie-wrap. Schneider Electric recommends that the tie-wrap connection point be on the cable jacket and not the individual wires.  | <p><b>Figure 8:</b></p>    |
| 4    | Each generic cable comes with a Brady label (Figure 8) included in the package. This label includes the I/O adapter commercial reference number, and also provides space for you to add additional information. For example, you can add reference to the previous and new backplane positions, plus legacy and new module numbers. Schneider Electric recommends that you install this label on the cable approximately one foot from the X80 connector (Figure 9). | <p><b>Figure 9:</b></p>  |

| Step | Action  |  |
|------|---|--|
| 5    | <p>Optional: Each generic cable comes with a marking flag (Figure 10) included in the package. This marking flag can be used to add information in addition to the information on the Brady label for ease of identification.</p> | <p><b>Figure 10:</b></p>  A close-up photograph showing a clear, rectangular plastic marking flag attached to a black cable. The flag is held in place by a small metal clip. The background is a light-colored, textured surface, likely metal. |

# Removing Existing Modules and Backplane

## ⚠️ DANGER

### RISK OF ELECTRIC SHOCK

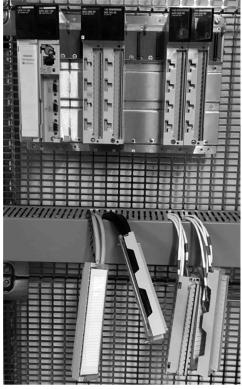

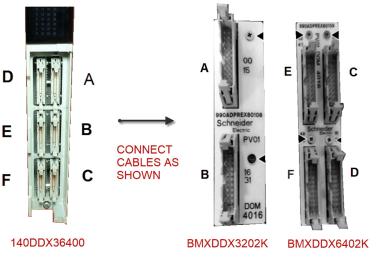

Before removing existing modules and backplane, turn off all power to the Quantum system including rack power, and I/O field power.

If there are unused Quantum AC or DC connections, disconnect the wires at the source (terminal strip, etc.) so the power is no longer present on the Quantum field connector.

**Failure to follow these instructions will result in death or serious injury.**

To remove existing modules and backplane:

| Step | Action  |
|------|---|
| 1    | Turn off all power to the Quantum rack, including rack power, I/O field power, and so forth (Figure 11).  |
|      | <b>Figure 11:</b><br>   |
| 2    | Remove any communications cabling from the PLC system and set them aside (if applicable).   |
| 3    | Schneider Electric recommends that you check each field wire connection to confirm that its wires are tightly fastened.   |
| 4    | (Optional) Label the Quantum field connector with its original slot number and module part number.  |
| 5    | Remove the Quantum I/O module field connectors. Select the following process that is appropriate for your connectors:<br><b>A. For modules with a removable terminal block:</b> <ol style="list-style-type: none"><li>1. Loosen the fastening screws on the top and bottom of the field wiring connector (Figure 12).</li><li>2. Remove the field connector by pulling it straight out from the module (Figure 13).<br/>Let the field connectors hang down (Figure 14).</li></ol> |

| Step        | Action   |
|-------------|--|
|             | <p><b>B.</b> For 140DDO36400 (96 point output) and 140DDI36400 (96 point input) modules with 20 position high density connectors:</p> <ol style="list-style-type: none"> <li>1. Identify the current 20 position high density connector cable location (A...F).</li> <li>2. Disengage the two locking latches.</li> <li>3. Pull to remove the 20 position high density connector (Figure 15), and connect to the corresponding adapter connector.</li> </ol> |

| Step | Action  |
|------|---|
| 6    | <p>Remove the Quantum I/O modules:</p> <ol style="list-style-type: none"> <li>1. Loosen the module retaining screw located at the lower section of the module.</li> <li>2. Grasp the bottom of the I/O module and rotate it up to disengage the backplane connection.</li> </ol> <p>Remove the module.</p>      |
| 7    | <p>Remove the Quantum backplane mounting hardware, and then remove the backplane.</p> <p><b>NOTE:</b> If the mounting hardware are machine screws, retain them for re-use. If the mounting hardware are bolts, it is recommended to replace them with machine screws when installing the Evolution chassis.</p> |

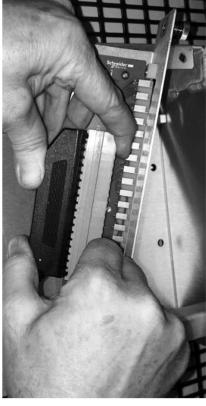

## Installing the Evolution PLC/IO Chassis Base Plate and Chassis Door

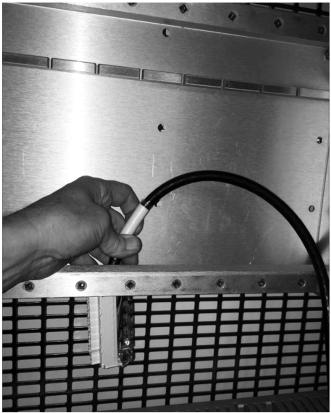

To install the Evolution PLC/IO Chassis base plate:

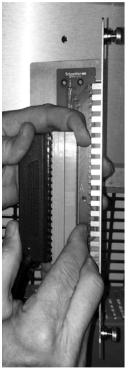

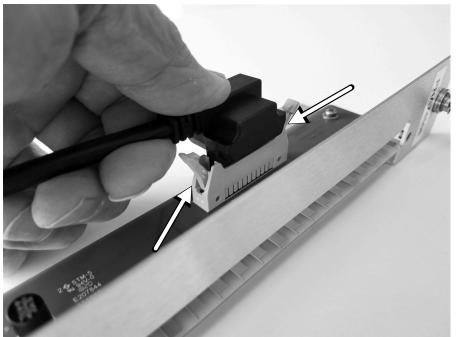

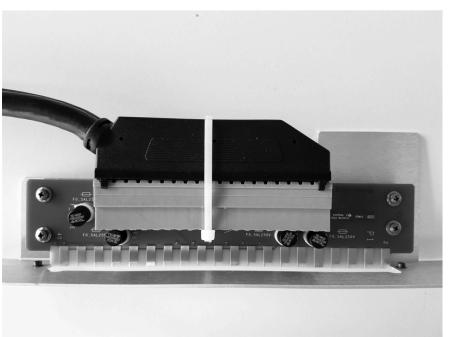

| Step | Action   |
|------|--|
| 1    | <p>The Evolution PLC/IO Chassis assembly is shipped with the front plate attached to the back plate. For ease of installation, you can detach the front plate before installing the base plate. To detach the front plate:</p> <ol style="list-style-type: none"> <li>1. Disengage each "L" shaped spring latch (one on each end of the front plate) by using your fingers to move them toward the center of the front plate, then pull it forward to the locking position (Figure 16).</li> <li>2. Swing the front plate open, and remove the retaining cables from the front plate (Figure 17).</li> <li>3. Slide the front plate off its pivot points (Figure 18).</li> </ol> |

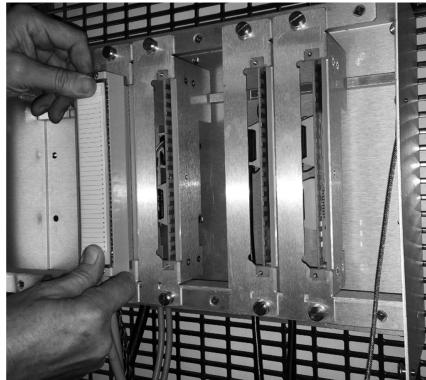

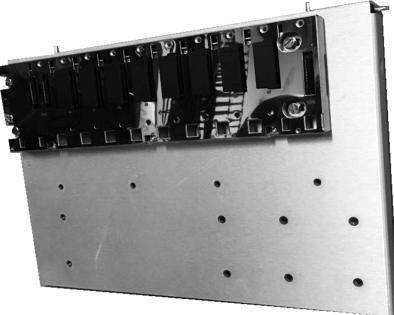

**Figure 16:**

# Installing the X80 System

To install the X80 system:

| Step | Action  |
|------|---|
| 1    | <p>Mount all the X80 modules required by your application (power supply, CPU, I/O, etc.) into the correct slots in the backplane. Fasten each module by tightening the captive Phillips/slot combination screw at the top of the module (Figure 32). The recommended tightening torque for this screw is 1.2...1.5 N·m (10.6...13.3 lb-in).</p>   |
| 2    | <p>Insert each X80 I/O field connector into its corresponding I/O module.</p> <p><b>NOTE:</b> X80 module I/O connector keying is recommended. Refer to the analog I/O (35011978) and discrete I/O (35012474) user guides for I/O connector key instructions.</p> <p>Tighten the captive Phillips head screw at the top and bottom of each connector. The recommended tightening torque for these screws is 0.3...0.4 N·m (2.7...3.5 lb-in).</p> |

**Figure 32:**

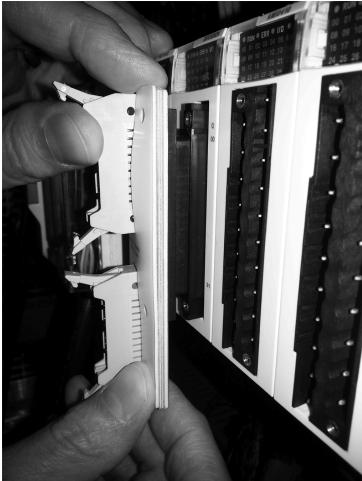

## NOTICE

### RISK OF MODULE SEPARATION

Do not tighten the top and bottom securing screws beyond the recommended tightening torque settings described in step 3, below.

**Failure to follow these instructions can result in equipment damage.**

| Step | Action   |
|------|--|
| 3    | <p>For 32 and 64 point X80 modules:</p> <ol style="list-style-type: none"> <li>1. Install the front mount adapter and tighten the top and bottom securing screws. The recommended tightening torque for these screws is 0,3...0,4 N·m (2,7...3,5 lb-in).</li> <li>2. If not already connected, connect field wiring cable by pushing each of the six Quantum I/O cable's 20 position socket connector (Figure 34) inwards into its corresponding X80 modules front mount adapters 20 position high density connectors. Verify that the two locking latches are engaged by squeezing the locking tabs.</li> </ol> <p><b>NOTE:</b> For 96 point modules, insert the Quantum I/O cable's 20 position socket connector (Figure 15) into the correct (A...F) module connectors and verify that the two locking latches are engaged by squeezing them.</p> |
|      | <p><b>Figure 33:</b></p>  <p><b>Figure 34:</b></p>    |
| 4    | Re-attach any other communications cables that previously had been detached.   |
| 5    | Optional: The cable management system can be installed on the upper X80 backplane to position and affix its cables to allow viewing of the lower X80 backplanes I/O modules display block (I/O channel indicators). This system is similar to the X80 shielding connection kit. For installation instructions, refer to the <i>Shielding Connection Kit</i> section of the <i>X80 Racks and Power Supplies Hardware Reference Manual</i> (EIP000002626).   |

## Additional Information

### I/O Adapter Replacement Cables:

You can also obtain replacement cables from Americas MRO. For part numbers, refer to the list of I/O Adapter Replacement Cables, page 34.

### Fuse Replacement Procedure:

Some translator units have replaceable fuses. The translator units with fuses include a spare fuse on the translator units, which is labeled SPARE or F100 on the PCB. The fuses on the translator units are inaccessible when the system is assembled. If fuse replacement is required, the I/O adapter assembly needs to be removed from the Evolution chassis for fuse access:

| Step | Action  |
|------|---|
| 1    | Remove power from the system.   |
| 2    | To access the I/O adapter assembly, disengage the "L" shape spring latch by moving towards the center of the front plate then pulling forward to the locking position then open the assembly (Figure 16).   |
| 3    | Remove the Quantum I/O module field connectors: <ol style="list-style-type: none"><li>Loosen the fastening screws on the top and bottom of the field wiring connector (Figure 9).</li><li>Remove the field connector by pulling it straight out from the module (Figure 10). Let the field connectors hang down (Figure 11).</li></ol>  |
| 4    | Unscrew the adapters securing screws.   |
| 5    | Partially remove the I/O adapter assembly from the chassis assembly, then remove the cables from the translator unit.   |
| 6    | Remove the translator unit from the chassis assembly.   |
| 7    | Replace the blown fuse: <ol style="list-style-type: none"><li>Pull the blown fuse straight out to remove it.</li><li>Line up the two pins of the new fuse with the socket on the adapter board, then push into place.</li></ol> Helpful Hint: Some fuses may be difficult to remove due to their positioning (Figure 35). Using a tool such as a needle tweezer (Figure 36), with its tips covered with shrink tubing or electrical tape, will make removing and inserting the fuse easier. |

| Step | Action   |   |
|------|--|---|
|      | <p><b>Figure 35:</b></p>    | <p><b>Figure 36:</b></p>  |
| 8    | Install the translator unit in the reverse order (steps 6 through 2, above).<br><b>NOTE:</b> When replacing the cables (step 4), verify that the cables are connected to the correct mating connector. |   |

## ⚠ WARNING

### RISK OF UNINTENDED OPERATION

When replacing the cables (step 4), verify that the cables are connected to the respective mating connector (cable A to connector A and cable B to connector B).

**Failure to follow these instructions can result in death, serious injury, or equipment damage.**

| Step | Action  |
|------|---|
| 9    | Close the chassis front plate and secure: push the "L" shaped spring latch towards the back to disengage from the locked position. The "L" shape spring latch will move outward to the locked position after they engage into the backplate. (Figure 28). Push outwards to confirm that they are fully engaged. |
| 10   | Apply power to the system and verify that it operates as intended.  |

| 1: In some cases X80 module BMXART0814 may be a suitable replacement for the 140ATI03000. The Cold Junction differences must be evaluated prior to the modernization. If the user <i>determines</i> that the BMXART0814 is an acceptable replacement for their installation, they can use Generic Adapter 990ADQUAX80102 for the modernization. The user will need to determine the appropriate wiring for their installation.           |                             |                                    |  |            |              |
| 2: The Quantum module is HART tolerant, the recommended X80 module is not. The X80 module is not recommend for direct replacement of the Quantum module where HART is incorporated into the analog channel wiring. The X80 module can be used if additional filtering is incorporated into the analog channel wiring, or the X80 HART module can be used. ## NOTICE

### RISK OF UNINTENDED OPERATION

The current loops on this X80 module are self-powered by the output channels and do not require any external supplies. Disconnect each of the analog output channel wires from its loop power supply, then connect the individual channel wires together.

**Failure to follow these instructions can result in equipment damage.**

## ⚠ CAUTION

### RISK OF UNINTENDED OPERATION

This I/O adapter assembly combines all Quantum input point VAC Neutrals (Returns). The X80 replacement module has one group of 16 inputs, unlike the Quantum module which has 16 isolated inputs. Verify that the point neutrals can be connected together. If not, do not use this I/O adapter.

### ⚠ CAUTION

#### RISK OF UNINTENDED OPERATION

This I/O adapter assembly combines the Quantum groups A & B VAC Neutrals/ DC commons and groups C & D VAC Neutrals/ VDC commons. Each of the two X80 replacement module has one group of 16 inputs, unlike the Quantum module which had 4 groups of 8 inputs. Verify that the point neutrals/commons can be connected together. If not, do not use this I/O adapter.

**Failure to follow these instructions can result in injury or equipment damage.**

### ⚠ CAUTION

#### RISK OF UNINTENDED OPERATION

This I/O adapter assembly combines the Quantum groups A & B VAC Neutrals and C & D VAC Neutrals. The X80 replacement modules have one group of 16 inputs, unlike the Quantum module which had 2 groups of 8 inputs. Verify that the point neutrals can be connected together. If not, do not use this I/O adapter.

**Failure to follow these instructions can result in injury or equipment damage.**

1. The X80 module requires the connection of +24 VDC to operate. Connect either to the Quantum field connector to utilize the on-board fuse, or directly to the X80 module, in which case it is recommended that an external fuse be installed (consult X80 I/O module manual for details).

## ⚠ CAUTION

### RISK OF UNINTENDED OPERATION

This I/O adapter assembly combines the Quantum groups A,B,C,D,E,F,G & H +24 VDCs. It also combines the Quantum groups A,B,C,D,E,F,G & H Returns. The X80 replacement module has one group of 16 inputs, unlike the Quantum module which had 8 groups of 2 inputs. Verify that the point commons can be connected together. If not, do not use this I/O adapter.

**Failure to follow these instructions can result in injury or equipment damage.**

## ⚠ CAUTION

### RISK OF UNINTENDED OPERATION

This I/O adapter assembly combines the Quantum groups A & B +24 VDCs and also combines Quantum groups C & D +24 VDCs. It also combines the Quantum groups A & B and it combines C & D Returns. The X80 replacement modules (2) have one group of 16 outputs, unlike the Quantum module which had 4 groups of 8 outputs. Verify that the point commons can be connected together. If not, do not use this I/O adapter.

**Failure to follow these instructions can result in injury or equipment damage.**

### CAUTION

#### RISK OF UNINTENDED OPERATION

This wiring guide combines the Quantum groups A & B VDC commons and groups C & D VDC commons. Each of the two X80 replacement modules has one group of 16 inputs, unlike the Quantum module which had 4 groups of 8 inputs. Verify that the point commons can be connected together. If not, do not use this I/O adapter.

1. Connect +125 VDC to these X80 pins for the modules to operate. Connection can be made on the Quantum connectors associated pin.

**NOTE:**

- Quantum Groups A,B and C Commons need to be commonized on the Quantum connector.
- The wiring is different for the two X80 modules, take care when wiring and installing the X80 connectors.

## NOTICE

### RISK OF UNINTENDED OPERATION

The X80 module does not have any surge suppression components for inductive loads. If the load is inductive, it is recommended either MOVs and/or RC snubbers be added externally. Refer to the Modicon X80 Discrete Input/Output Modules User Manual (35012474) for more details.

**Failure to follow these instructions can result in equipment damage.**

## ⚠ CAUTION

### RISK OF UNINTENDED OPERATION

The output channels of this X80 module do not include fusing within the module or on the translator unit. It is recommended that external fusing be added for this module as detailed in the Modicon X80 Discrete Input/Output Modules User Manual (35012474).

**Failure to follow these instructions can result in injury or equipment damage.**

## ⚠ CAUTION

### RISK OF UNINTENDED OPERATION

This wiring guide combines the Quantum groups A and B VDC supplies. It also combines the Quantum groups A and B commons. The X80 replacement module has one group of 16 outputs, unlike the Quantum module which had 2 groups of 8 outputs. Verify that the point commons can be connected together. If not, do not use this I/O adapter.

**Failure to follow these instructions can result in injury or equipment damage.**

## NOTICE

### RISK OF UNINTENDED OPERATION

The X80 module does not have any surge suppression components for inductive loads. If the load is inductive, it is recommended either MOVs and/or RC snubbers be added externally. Refer to the Modicon X80 Discrete Input/Output Modules User Manual (35012474) for more details.

**Failure to follow these instructions can result in equipment damage.**

1. Connect +24 VDC to these X80 pins for the modules to operate. Connection can be made on the Quantum connectors associated pin.

# Wiring Guide 10: 990ADQUAX80142, 990ADQUAX80143

The Quantum 140AMM09000 analog channels are differential, whereas the X80 BMXAMM0600 analog channels are single-ended. In some cases, the BMXAMM0600 will not be a suitable replacement for the 140AMM09000. In these cases, individual X80 analog input and output modules can be substituted for the BMXAMM0600 mixed module.

**NOTE:** This Quantum module is HART compatible, the recommended X80 module is not. The X80 module is not recommended for direct replacement of the Quantum module where HART is incorporated into the analog channel wiring. The X80 module can be used if additional filtering is incorporated into the analog channel wiring.

## NOTICE

### RISK OF UNINTENDED OPERATION

The current loops on this X80 module are self-powered by the output channels and do not require any external supplies. Disconnect each of the analog output channel wires from its loop power supply, then connect the individual channel wires together.

**Failure to follow these instructions can result in equipment damage.**

### **Cable Management System:**

An accessory that consists of a metal bar plus two sub-bases that are affixed to the X80 backplane. You can attach I/O adapter cables of X80 modules on the upper X80 backplane to the metal bar. This allows positioning and affixing of the upper module cables providing an unobstructed view of the display blocks (I/O channel indicators) of the I/O modules located in the lower X80 backplane. The cable management system can also be used to provide a ground connection for analog cable shielding.

**Cables:**

Used to connect the translator unit to the X80 module. Types include:

- Dedicated Cables: These cables have a molded connector on one end for connecting to the I/O adapter PCB and an X80 connector on the other end for connecting to the X80 I/O module. These cables are wired pin 1 to pin 1, pin 2 to pin 2, and so forth.  
Types include:
  - High Power Cable: These cables have larger gauged wire for high current and/or high voltage. They have an in-line 20 or 40 pin molded connector for connection to the adapter PCB.
  - High Density Cable: These cables have smaller gauged wired for low current and/or low voltage. They have a 20 position high density connector for connection to the adapter PCB.
  - Analog Cable: These cables have smaller gauged wire for analog signals. They have a 20 or 28 position high density connector and a shield wire with ring lug for connection to the adapter PCB.
- Pig Tail Cables: These cables have a molded connector on one end for connecting to an I/O adapter PCB and pig tail wires (flying leads) on the other end. The pig tail wires are color coded and have wire number labels (1...20). The wires of the pig tail cable need to be connected to the X80 connector that is included in the I/O adapter assembly. Types include:
  - High Power Pig Tail Cable: These cables have larger gauged wire for high current and/or high voltage. They have an in-line 20 or 40 pin molded connector for connection to the adapter PCB and color-coded wires on the other. These wires are then connected to the X80 connector per the appropriate wiring guide.
  - High Density Cable: These cables have smaller gauged wire for low current and/or low voltage. They have an HE20, 20 pin molded connector for connection to the adapter PCB and color-coded wires with ferrules on the other. These wires are then connected to the X80 connector per the appropriate wiring guide.
  - Analog Cable: These cables have smaller gauged wired for analog signals. They have a 20 or 28 position high density connector and a shield wire with ring lug for connection to the adapter PCB and color-coded wires with ferrules on the other. These wires are then connected to the X80 connector per the appropriate wiring guide.
- Replacement Cables: These cables are the same as listed in Dedicated and Pigtail sections, above with one exception: the Pig Tail replacement cables do not come with an X80 connector.

## **Chassis:**

A two-piece metal assembly which allow the X80 PAC system to be mounted to it and houses the I/O adapters and Quantum field connectors. The parts include:

- Back plate: The back part of the chassis, which is mounted in the cabinet in the same location as the Quantum backplane. It houses the I/O adapters and Quantum field connectors.
- Front plate: The door on the front of the chassis, which opens and is removable. This is where the X80 backplanes are mounted.

## **I/O Adapter Assembly:**

Complete assembly that contains the translator unit and cable, which mount in the chassis and connects the field device wiring to the appropriate X80 module pins. Types include:

- Dedicated I/O Adapter: These assemblies mount to the chassis assembly and contain the PCB that performs the wiring translations from Quantum to X80 connector pins. These assemblies use the dedicated cables. Some adapters may require the addition of a power connection necessary for the X80 module. These connections can be added to the Quantum or X80 connector. Refer to the appropriate wiring maps for this information.
- Generic I/O Adapter: These assemblies mount to the chassis assembly and contain the I/O adapter PCBs that **do not** perform the wiring translation. The signal translation is performed by the cable wiring only.
- Front Mount Adapters: These adapter assemblies accept 20 position high density connectors and connect directly to X80 module high density connectors on the 32 and 64 channel X80 modules. The signal translations are performed by the PCB of the adapter.

## **M**

### **Mounting Plate:**

A metal plate similar to a Quantum backplane, which provides hole patterns that allow two X80 backplanes to be mounted. There are three sizes of mounting plates: 6, 10 and 16 slot. Each has the same mounting hole pattern as the Quantum backplane it replaces. These mounting plates can be used when no I/O adapter assemblies are being used in the modernization, for example, if you rewire the field wiring or system that currently uses the Cablefast wiring systems.

## T

### **Translator Unit:**

Consists of a printed circuit board (PCB) assembly and a metal mounting plate. The PCB routes the Quantum field connections to the PCB mounting connector headers and the mounting plate holds the PCB and affixes it to the chassis.

## W

### **Wiring Guide:**

Tables for the Generic Adapters that provide the wiring instructions necessary to complete the required signal translations at the field connector(s). The adapter PCB does not provide the wiring translations from Quantum to X80 connector pins, only straight through connections.

**NOTE:** No circuit protection is provided by the generic I/O adapter PCB or cable.

### **Wiring Map:**

Tables for the Dedicated Adapters that provide signal names and pin assignments from the Quantum module, to the X80 replacement module.
