1. INTRODUCTION

The present document is a chapter of the PACiS SMT manual. It describes the safety, handling, packing and unpacking procedures applicable to PACiS SMT software tools.
2. SAFETY

WARNING: THIS SAFETY SECTION SHOULD BE READ BEFORE COMMENCING ANY WORK ON THE EQUIPMENT.

2.1 Health and Safety
The information in the Safety Section of the product documentation is intended to ensure that products are properly installed and handled in order to maintain them in a safe condition. It is assumed that everyone who will be associated with the equipment will be familiar with the contents of the Safety Section and all Safety documents related to the PC and Communication networks.

2.2 Explanation of symbols and labels
The meaning of symbols and labels may be used on the equipment or in the product documentation, is given below.

2.3 Installing, Commissioning and Servicing

Equipment operating conditions

![Warning Icon] The equipment (PC and communication network supporting PACiS SMT) should be operated within the specified electrical and environmental limits.

Fibre optic communication

![Warning Icon] Optical LED transceivers used in Switch boards are classified as IEC 825-1 Accessible Emission Limit (AEL) Class 1 and consequently considered eye safe.

Optical power meters should be used to determine the operation or signal level of the device.

2.4 Decommissioning and Disposal

Disposal:

It is recommended to avoid incineration and disposal of the PACiS SMT CD-ROM. The product should be disposed of in a safe manner.
3. GUARANTEES

The media on which you received Schneider Electric software are warranted not to fail executing programming instructions, due to defects in materials and workmanship, for a period of 90 days from date of shipment, as evidenced by receipts or other documentation. Schneider Electric will, at its option, repair or replace software media that do not execute programming instructions if Schneider Electric receives notice of such defects during the guaranty period. Schneider Electric does not guaranty that the operation of the software shall be uninterrupted or error free.

A Return Material Authorisation (RMA) number must be obtained from the factory and clearly marked on the package before any equipment acceptance for guaranty work. Schneider Electric will pay the shipping costs of returning to the owner parts, which are covered by warranty.

Schneider Electric believes that the information in this document is accurate. The document has been carefully reviewed for technical accuracy. In the event that technical or typographical errors exist, Schneider Electric reserves the right to make changes to subsequent editions of this document without prior notice to holders of this edition. The reader should consult Schneider Electric if errors are suspected. In no event shall Schneider Electric be liable for any damages arising out of or related to this document or the information contained in it.

Expect as specified herein, Schneider Electric makes no guaranties, express or implied and specifically disclaims and guaranties of merchantability or fitness for a particular purpose.

Customer's rights to recover damages caused by fault or negligence on the part Schneider Electric shall be limited to the amount therefore paid by the customer. Schneider Electric will not be liable for damages resulting from loss of data, profits, use of products or incidental or consequential damages even if advised of the possibility thereof.

This limitation of the liability of Schneider Electric will apply regardless of the form of action, whether in contract or tort, including negligence. Any action against Schneider Electric must be brought within one year after the cause of action accrues. Schneider Electric shall not be liable for any delay in performance due to causes beyond its reasonable control.

The warranty provided herein does not cover damages, defects, malfunctions, or service failures caused by owner's failure to follow the Schneider Electric installation, operation, or maintenance instructions; owner's modification of the product; owner's abuse, misuse, or negligent acts; and power failure or surges, fire, flood, accident, actions of third parties, or other events outside reasonable control.
4. COPYRIGHTS & TRADEMARKS

4.1 Copyrights

Under the copyright laws, this publication may not be reproduced or transmitted in any form, electronic or mechanical, including photocopying, recording, storing in an information retrieval system, or translating, in whole or in part, without the prior written consent of Schneider Electric.

4.2 Trademarks

PACiS, PACiS SCE, PACiS ES, PACiS SMT, PACiS PS are trademarks of Schneider Electric. Product and company names mentioned herein are trademarks or trade names of their respective companies.
5. **WARNINGS REGARDING USE OF SCHNEIDER ELECTRIC PRODUCTS**

Schneider Electric products are not designed with components and testing for a level of reliability suitable for use in or in connection with surgical implants or as critical components in any life support systems whose failure to perform can reasonably be expected to cause significant injuries to a human.

In any application, including the above reliability of operation of the software products can be impaired by adverse factors, including -but not limited- to fluctuations in electrical power supply, computer hardware malfunctions, computer operating system, software fitness, fitness of compilers and development software used to develop an application, installation errors, software and hardware compatibility problems, malfunctions or failures of electronic monitoring or control devices, transient failures of electronic systems (hardware and/or software), unanticipated uses or misuses, or errors from the user or applications designer (adverse factors such as these are collectively termed "System failures").

Any application where a system failure would create a risk of harm to property or persons (including the risk of bodily injuries and death) should not be reliant solely upon one form of electronic system due to the risk of system failure to avoid damage, injury or death, the user or application designer must take reasonably steps to protect against system failure, including -but not limited- to back-up or shut-down mechanisms, not because end-user system is customised and differs from Schneider Electric testing platforms but also a user or application designer may use Schneider Electric products in combination with other products.

These actions cannot be evaluated or contemplated by Schneider Electric; Thus, the user or application designer is ultimately responsible for verifying and validating the suitability of Schneider Electric products whenever they are incorporated in a system or application, even without limitation of the appropriate design, process and safety levels of such system or application.

1. INTRODUCTION TO PACiS

The PACiS range will continue to be expanded. The general features of PACiS will also be enhanced, as we are able to adopt new technology solutions.

For up-to-date information on any PACiS product, visit our website: www.schneider-electric.com
2. INTRODUCTION TO PACiS GUIDES

This version of the PACiS SMT documentation refers to version PACiS V4.8. The guides provide a functional and technical description of the PACiS System Management Tools (SMT) and a comprehensive set of instructions for the PACiS SMT’s use and application.

PACiS SMT guides are divided into two volumes, as follows:

- Operation Guide: includes information on the application of the PACiS SMT and a technical description of its features. It is mainly intended for protection & control engineers concerned with the selection and application of the PACiS SMT for the Management of PACiS solution or of any of the PACiS equipment.

- Technical Guide: contains information on the installation and commissioning of the PACiS SMT, and also a section on fault finding. This volume is intended for site engineers who are responsible for the installation, commissioning and maintenance of the PACiS SMT application.

2.1 Chapters description

2.1.1 Chapter Safety (SA)
This chapter contains the safety instructions, handling and reception of electronic equipment, packing and unpacking parts, Copyrights and Trademarks.

2.1.2 Chapter Introduction (IT)
This is this document containing the description of each chapter of the PACiS SMT guides. It is a brief introduction to PACiS SMT capabilities.

2.1.3 Chapter Functional Description (FT)
This chapter contains a description of the product. It describes functions of the PACiS SMT.

2.1.4 Chapter Technical Data (TD)
This chapter contains the technical data including, accuracy limits, recommended operating conditions, ratings and performance data. It also describes environment specification, compliance with technical standards.

2.1.5 Chapter HMI, Local control and user interface (HI)
This chapter contains the operator interface description, Menu tree organisation and navigation, Setting/configuration software.

2.1.6 Chapter Installation (IN)
This chapter contains the installation procedures.

2.1.7 Chapter Commissioning (CM)
This chapter contains instructions on how to commission PACiS SMT, comprising checks on the settings and functionalities.

2.1.8 Chapter Commissioning record sheet (RS)
This chapter provides detailed record sheets to commission PACiS SMT.

2.1.9 Chapter Logical Diagrams (LG)
This chapter describes the Logical functions and automations of PACiS SMT.

2.1.10 Chapter Applications (AP)
Comprehensive and detailed description of the features of the PACiS SMT.

2.1.11 Chapter Settings (ST)
This chapter contains the list of the setting with defaults values and range.
2.1.12 Chapter Maintenance, Fault finding, Repairs (MF)  
This chapter advice on how to recognise failure modes, fault codes and describes the recommended actions to repair.

2.1.13 Chapter Problem analysis (PR)  
This chapter advice on practical examples of problem solving and the company contact information. It includes all information on the self-checking features and diagnostics of PACIS SMT.

2.1.14 Chapter Lexical (LX)  
This chapter contains lexical description of acronyms and definitions.

2.2 Operation guide  
This manual contains the following chapters:
SA, IT, TD, FT, HI, AP, LX

2.3 Technical guide  
This manual contains the following chapters:
SA, IT, TD, FT, IN, HI, ST, LG, CM, RS, MF, PR, LX
3. INTRODUCTION TO PACiS SMT APPLICATIONS

The PACiS System Management Tool (PACiS SMT) is in charge of:

- The downloading of the configuration provided by the PACiS System Configuration Editor (PACiS SCE) into the PACiS applications,
- The management of the running modes for these PACiS applications,
- Automatic uploading of disturbance files from IEC 61850 IEDs (PACiS or non-PACiS) and legacy IED through PACiS computer,
- The monitoring of non PACiS IEC 61850 applications,
- Launching MiCOM S1 Studio in order to have a direct connection between the MiCOM S1 and the IED. This facility is available for IEC61850 IEDs and legacy IEDs.

</tr>
</tbody>
</table>
1. SCOPE OF THE DOCUMENT

This document is a chapter of the PACiS SMT manual. It is the functional description of PACiS software application dedicated to the management of the PACiS system and sub-systems.
2. PACiS SMT ARCHITECTURE

2.1 PACiS SMT Logical Architecture

PACiS SMT application is composed of two major software components:

- PACiS SMT
- IEC 61850 agency

The IEC 61850 agency is a generic component used in all PACiS devices. This component is described in [SBUS_AGENCY] reference document, from a user point of view. The IEC 61850 agency offers services to a set of applications.

PACiS SMT is one of these applications. It just uses client side services. In the SMT software the IEC agency is a DLL.

Other applications can use the IEC 61850 agency. But there is no impact on PACiS SMT.

The IEC 61850 agency supports:

- The IEC 61850 device interface,
- The IEC 61850 protocol management function.

PACiS SMT supports all others functions (i.e. that are not communication related) and the other system external interfaces.

PACiS SMT sees the “IEC 61850 world” only through the “IEC 61850 agency”.

The following sections apply to describe the PACiS SMT component.
2.2 PACiS SMT Architecture

It is made of two software components:

- The System Management tool HMI (SysMntHMI).
- The System Management tool Kernel (SysMntKernel).

PACiS SMT is made up of only one PACiS SMT Kernel, which communicates with several PACiS SMT HMI.

PACiS SMT Kernel manages the global state of PACiS SMT.

It assumes the communication with the IEC 61850 agency, is responsible for the storage and access to SystemDataBag, and manages requests from all PACiS SMT HMI.

PACiS SMT HMI manages the User Interface.

PACiS SMT is distributed over two different hardware types:

- Desktop PC, for HMI part (on which PACiS SMT HMI software runs)
- Server PC, for kernel part (on which PACiS SMT Kernel software runs)

The following figure describes the link between the physical architecture and the logical architecture:

![Physical and Logical Architecture Relation](image)

FIGURE 2: PHYSICAL AND LOGICAL ARCHITECTURE RELATION

The Desktop PC is a standard PC computer for HMI purpose:

- colour display,
- mouse,
- keyboard,
- network card.
The Server PC is a standard PC computer with data storage and data export and import feature:

- data file system,
- removable storage devices (CD-ROM, tape, floppy).

Some Desktop PC can be remote and uses public network like Internet to access the Server PC.

A PACiS system contains only one Server PC; this software does not limit the number of Desktop PC and IEC 61850 devices.
INSTALLATION

BLANK PAGE
1. SCOPE OF THE DOCUMENT

This document is a chapter of the PACIS SMT documentation. It describes the product installation and start-up settings. Before any application software handling the chapter SA should be read carefully.

This document is split in the following parts:

- Installation of PACiS SMT KERNEL
- Installation of PACiS SMT HMI
- Settings to run properly the PACiS SMT application
2. REQUIREMENTS

2.1 Software configuration

The OS required to run PACiS SMT is Microsoft® Windows Seven Pro 32Bits SP1 or Windows XP Pro SP3 (or later) or XP Windows XP Embedded.

2.2 Hardware configuration

The minimum hardware requirements to correctly operate the PACiS SMT applications show in the table that follows:

<table>
<thead>
<tr>
<th></th>
<th>Windows 2003 Server</th>
<th>Windows Seven / XP</th>
<th>Windows XP Embedded</th>
</tr>
</thead>
<tbody>
<tr>
<td>CPU</td>
<td>PC Core II duo 2.66 GHz (or more)</td>
<td>Pentium IV – 3 GHz (or more)</td>
<td></td>
</tr>
<tr>
<td>RAM</td>
<td>1024 Mbytes</td>
<td>2048 Mbytes</td>
<td>2048 Mbytes</td>
</tr>
<tr>
<td>Hard disk</td>
<td>40 Gbytes</td>
<td>120 Gbytes</td>
<td>80 Gbytes</td>
</tr>
<tr>
<td>CD Reader</td>
<td>YES</td>
<td>YES</td>
<td>YES</td>
</tr>
<tr>
<td>Ethernet port</td>
<td>100 Mbytes</td>
<td>100 Mbytes</td>
<td>100 Mbytes</td>
</tr>
</tbody>
</table>
3. INSTALLATION

NOTE: The SMT can be installed on the same PC as OI client (you will be able to switch between them) or GTW.

This chapter describes the SMT application installation. The IEC 61850 agency module must be installed separately from the PACiS SMT application.

PACiS SMT KERNEL installation can only be done from the CD-ROM.

PACiS SMT HMI installation can be done from the CD-ROM, or from the PACiS SMT KERNEL PC using PACiS SMT HMI set-up (also known as remote PACiS SMT HMI installation).

In all cases the program group named SMT is created in PACiS program group. This PACiS SMT group contains shortcut(s) to run PACiS SMT HMI and the PACiS SMT KERNEL.

Once components have been installed they can be personalised.

To work properly, the PACiS SMT needs at least Java Runtime Environment (JRE®) release. When installing the PACiS SMT component(s) from CD-ROM or from the PACiS SMT KERNEL PC using installation software, this installation software looks for JRE®: if JRE® is not found, or if the JRE® installed release is not at least release 1.4.2, JRE® 1.4.2_10 or JRE® 6 installation is proposed.

NOTE: The cyber-security is ensured without using all Windows services (in particular some Windows Firewall services can be disabled). Please refer on chapter PACiS/CS for cyber-security recommendations

If a component was already installed on the PC, all the parameter values defined in its initialisation file are copied out.

Before beginning the installation on Windows Seven, check and do following:

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
</table>
| 1    | Administrator rights  
The Installation on Windows Seven must to be done with Administrator rights. |
| 2    | Disabling Windows Update  
The Windows Update from the Control Panel is to be inactive.  
  - Access "Control Panel > System and Security > Windows Update"  
  - Click "Turn Windows Update on or off"  
  - Choose option "Never check for updates" |

![Image showing how to disable Windows Update]
<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
</table>
| 3    | **Disabling Windows Firewall**<br>The Windows Firewall from the Control Panel has to be inactive.  
• Access "Control Panel > System and Security > Windows Firewall"  
• Click "Turn Windows Firewall on or off"  
• Choose options "Turn off Windows Firewall" |
| 4    | Check the WinPcap version 4.1.2 or higher |
| 5    | • Access "Control Panel > System"  
• Click "Advanced system settings" in the Wizard.  
• Click "Settings..." |
### Installation constraints

- If a PACiS SMT HMI has already been installed from the CR-ROM on a PC, it's not possible to install a PACiS SMT HMI from the PACiS SMT KERNEL PC, and vice-versa,

- If a single component (i.e. PACiS SMT KERNEL or PACiS SMT HMI) is installed, a new installation of this component at another location implies that previous installation is "lost" and will have to be uninstalled manually,

- If only PACiS SMT KERNEL is installed, it will not be possible to install a PACiS SMT HMI in the future, without "loosing" PACiS SMT KERNEL installation - then if you plan to install a PACiS SMT HMI with the PACiS SMT KERNEL you must install it when installing the PACiS SMT KERNEL,

- If only PACiS SMT HMI is installed, it will not be possible to install a PACiS SMT KERNEL in the future, without "loosing" PACiS SMT HMI installation - then if you plan to install a PACiS SMT KERNEL with the PACiS SMT HMI you must install it when installing the PACiS SMT HMI,

- If both PACiS SMT KERNEL and PACiS SMT HMI have been installed, it's possible to install only PACiS SMT KERNEL or PACiS SMT HMI at the same location - installing a new PACiS SMT KERNEL or PACiS SMT HMI (or both) at a different location implies that previous installation is "lost" and will have to be uninstalled manually,

- It is not possible to install PACiS SMT HMI set-up without PACiS SMT KERNEL, even if a previous PACiS SMT KERNEL release is already installed.
### 3.2 Basic installation from CD-ROM

#### 3.2.1 Before Installing

Before beginning the installation on Windows Seven, check and do following:

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td><strong>Administrator rights</strong>&lt;br&gt;The Installation on Windows Seven must be done with Administrator rights.</td>
</tr>
<tr>
<td>2</td>
<td><strong>Disabling Windows Update</strong>&lt;br&gt;The Windows Update from the Control Panel has to be inactive.&lt;br&gt;- Access &quot;Control Panel &gt; System and Security &gt; Windows Update&quot;&lt;br&gt;- Click &quot;Turn Windows Update on or off&quot;&lt;br&gt;- Choose option &quot;Never check for updates&quot;</td>
</tr>
<tr>
<td>3</td>
<td><strong>Disabling Windows Firewall</strong>&lt;br&gt;The Windows Firewall from the Control Panel has to be inactive.&lt;br&gt;- Access &quot;Control Panel &gt; System and Security &gt; Windows Firewall&quot;&lt;br&gt;- Click &quot;Turn Windows Firewall on or off&quot;&lt;br&gt;- Choose options &quot;Turn off Windows Firewall&quot;</td>
</tr>
</tbody>
</table>
3.2.2 Installing

**NOTE:** On Windows Seven, the SMT Installation and execution must be done with Administrator rights.

If a PACIS SMT KERNEL or a PACIS SMT HMI is running user will be prompted to stop them before continuing the installation.

Just a double click on SMT-R3.exe is needed for launching PACIS SMT set-up. After the welcome window, you need to read the Licence Agreement and to accept it.

![Software License Agreement](Image)

**FIGURE 1: LICENSE AGREEMENT**

You need then to select the components to be installed using the following dialog box:

![Select Components](Image)

**FIGURE 2: COMPONENT SELECTION**
Select the component(s) you want to install.

PACiS SMT HMI set-up is used for PACiS SMT HMI remote installation from PACiS SMT KERNEL PC (without CR-ROM).

The next dialog box asks for the destination folder (PACiS SMT location: SMT_DIR):

![Choose location dialog box](image)

**FIGURE 3: CHOOSE LOCATION**

The default location is `C:\Program Files\Pacis\Smt`. The user can change this default destination folder with the "Browse" button.

If PACiS SMT has already been installed, the location proposed is the last one used (location for the current version); changing this location in this case (a previous release is installed) will involve that the previous PACiS SMT should be explicitly uninstalled by removing the relevant directories (from now, uninstall (see 0.) concerns the new PACiS SMT location).

If PACiS SMT has already been installed, the parameters of the current version (in `kernel.ini` and `hmi.ini`) will be proposed as the default value for the current installation.

If the new release is installed at the same place than the previous one, old `.properties` files are saved in `*.properties_bak`, old `%SMT_DIR%/exe/help/PACiS SMT HMI` files are saved in `%SMT_DIR%/exe/help/PACiS SMT HMI/bak` directory and old `%SMT_DIR%/exe/help/PACiS SMT KERNEL` files are saved in `%SMT_DIR%/exe/help/PACiS SMT KERNEL/bak` directory.
The next dialog box allows to select the COMTRADE revision year (per default COMTRADE 2001).

**FIGURE 4: SELECT COMTRADE REVISION YEAR**

The two or three next dialog boxes allow to modify the PACiS SMT default parameters. These parameters are then inserted in PACiS SMT initialisation files (PACiS SMT KERNEL.ini and PACiS SMT HMI.ini in %SMT_DIR%).

**FIGURE 5: KERNEL AND HMI PARAMETERS**

- **RMI port**: port opened by PACiS SMT KERNEL for RMI exchanges with PACiS SMT HMI (must be included between 0 and 65535),
• Mcast port: port opened by each PACiS SMT HMI for receiving multicast messages from PACiS SMT KERNEL (must be included between 0 and 65535),

• 1 Mcast ad: multicast address for system DB messages (230.0.0.251 for device status and 230.0.0.252 for log). Reminder: a multicast address must be included between 224.0.0.0 and 239.255.255.253.

WARNING: IF SEVERAL PACiS SMTS ARE INSTALLED OVER A GLOBAL NETWORK (I.E. EACH PACiS SYSTEM DOES NOT HAVE ITS OWN ISOLATED NETWORK), THE “MCAST PORT” AND “1 MCAST AD” PARAMETERS MUST BE DIFFERENT AND THERE MUST NOT BE ANY COVERING BETWEEN MULTICAST ADDRESSES.

If only PACiS SMT HMI is installed the third and last parameter dialog box is the following:

![SMT HMI parameters (3)](image)

- KERNEL add: name/IP address of the PC where PACiS SMT KERNEL is installed
If PACiS SMT KERNEL is installed the third parameter dialog box is the following:

![SMT Kernel parameters (3)](image)

- **max DB sz**: maximum size (in Kbytes) allowed for storing system databases.
- **max Dist sz**: maximum size (in Kbytes) allowed for storing disturbance files.

**WARNING:** FOR MAX DB FOR BIG BD USED 10,000,000 SIZE MAX

If PACiS SMT KERNEL is installed the fourth parameter dialog box is the following:

![SMT Kernel parameters (4)](image)

Choose disturbance files storage location. To select a different folder click browse.

WARNING: FOR MAX DB FOR BIG BD USED 10,000,000 SIZE MAX
Disturbance files storage location: default value can be modified using the browse button. Once value is entered the installation program tries to create the directory if it doesn't exist: if it fails the user has to set a new directory name which can be created (the parameter can be modified after installation in PACiS SMT KERNEL.ini).

Disturbance converter files are stored under \%SMT_DIR\%disturbance_converters directory. This location can be changed after installation in PACiS SMT kernel.ini file with DisturbanceConvertersPath parameter.

By default DisturbanceConvertersPath=C:\Program Files\Pacis\Smt\disturbance_converters\COMTRADE2001" to DisturbanceConvertersPath=C:\Program Files\Pacis\Smt\disturbance_converters\COMTRADE1997 to switch from 2001 to 1997 revision year of the COMTRADE standard.

A new parameter has been added to the kernel.ini file. This parameter is used to define an additional storage path for the disturbance files. The disturbance files will be store in the default directory AND in this additional directory. This additional directory name may point to a remote PC identified by its IP address or an network name.

Example: DisturbanceAlternateStoragePath = \PCLD533NT5\Disturbance

Where PCLD533NT5 is a remote PC network name and DisturbanceDir a directory on this remote PC. The remote directory must be shared to allow the file transfer from the SMT PC to the remote PC, sharing with "Full control" permission – writing and reading.

For a diskless PC, the SMT INSTALLATION requires the definition of a remote folder (i.e. on another PC) in order to store all files managed by the SMT (log files, databases, disturbance files).

FIGURE 9: SMT DATA STORAGE ROOT

NOTE: If the field "Storage dir" is used, it must be shared with the current PC, sharing with "Full control" permission – writing and reading.

Example: SmtDataRoot=\10.22.186.122\pacis\smt_data_root
### 3.2.3 After Installing

**After PACIS SMT Installation on Windows Seven, do following:**

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
</table>
| 1    | - Select **PACIS SMT Kernel Shortcut**  
      | - Click **Right**  
      | - Choose **Properties**  |
| 2    | - The "**Properties**" dialog box:  
      |   - Choose **Compatibility**  
      |   - Validate option **Run this program in compatibility mode for:**  
      |   - Choose **Windows Vista (Service Pack 2)**  
      |   - Validate option **Run this program as an administrator**  
<pre><code>  |   - Click **Apply** |
</code></pre>
<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
</table>
| 3    | • Select PACIS SMT Hmi Shortcut  
      • Click Right  
      • Choose Properties |
| 4    | • The "Properties" dialog box:  
      • Choose Compatibility  
      • Validate option Run this program in compatibility mode for:  
      • Choose Windows Vista (Service Pack2)  
      • Validate option Run this program as an administrator  
      • Click Apply |

**NOTE:** SMT needs a network connection (with status "connected") to run; network connections on PC (with status "not connected") has to be disable.
3.3 PACiS SMT Remote HMI installation

As already said, PACiS SMT HMI can be installed alone on another PC where PACiS SMT KERNEL is installed. This implies that the \%SMT\_DIR\%/install\_hmi directory located on PACiS SMT KERNEL PC must be shared for reading:

- Right-click \%SMT\_DIR\%/install\_hmi and then click Properties
- In the displayed dialog box (caption: install\_hmi properties) click the Sharing tabbed panel, click the Share this folder radio button and then click the OK button.

![FIGURE 10: REMOTE HMI INSTALLATION (STEP 1)]
From PACiS SMT HMI PC, you must open a network device with the PACiS SMT KERNEL PC (don't use network neighbourhood), and copy the "install_hmi" folder on the local machine. From the copied folder, launch the "install.bat" command.

![FIGURE 11: REMOTE HMI INSTALLATION (STEP 2)](image)

There's no parameter to give during installation.

The following message appears in the console window: “WARNING: installation in progress DO NOT REMOVE THIS WINDOW”. So you must wait for the self deletion of the console window (it takes around 5 seconds).

### 3.4 Installation result

**WARNING:** IF A PREVIOUS RELEASE OF PACiS SMT KERNEL WAS ALREADY INSTALLED AT THE SAME LOCATION, GENERATED SYSTEM DATABASES (LOCATED IN `%SMT_DIR%/SAVEOBJECT/DB`) MAY BE NOT COMPATIBLE WITH THE NEW INSTALLED RELEASE.

In this case, PACiS SMT KERNEL cannot start normally, all these “system DB” directories are removed and PACiS SMT KERNEL exits. When the operator launches the PACiS SMT KERNEL again, no system database exits and the operator has to restore its previous current system database.

**NOTE:** Current and standby databases are logged when PACiS SMT KERNEL exits.

Once the PACiS SMT installation is performed, PACiS SMT KERNEL or PACiS SMT HMI can be directly launched from Start Menu/Programs/Pacis/K.xx.xx/Smt.

A shortcut for PACiS SMT KERNEL launching is added in the startup folder.

Once you have clicked on the executable, an icon appears in the system tray and looks like the following:
3.5 Post installation tuning

NOTE: Values entered during installation process can be tuned in *.ini files.

3.5.1 General

Before running PACiS SMT KERNEL don't forget to:

- check that the IEC 61850 agency has already been installed
- tune the PACiS SMT/agency heart beat period.

3.5.2 Disturbances files converters

Their location/use is organised as follows:

- If the parameter d<xx>FileConverter (xx ∈ [00,99]) contains no path (just a file name), PACiS SMT KERNEL searches the converter in the default disturbance converter path (defined in DisturbanceConvertersPath),
- If the parameter d<xx>FileConverter contains a relative path, then this path is used to complete the default disturbance converter path,
- If the parameter d<xx>FileConverter contains an absolute path, PACiS SMT KERNEL searches the converter without taking into account the default disturbance converter path.

Then copy/organise the converter location according to the above rules.

3.6 Customization

This can be done in initialisation files located in %SMT_DIR%/exe directory: kernel.ini for Kernel, and Hmi.ini for PACiS SMT HMI.

The typical content of these files is given in appendix, but only parameters described hereafter should be modified (others parameters are set at installation, and should normally not be modified).

You can also right click on the sys-tray icon, select Configure Kernel, then Show/Kernel param.

3.6.1 PACiS SMT HMI

For PACiS SMT HMI can be tuned:

- the log editor
- the log file extension
- the buffer size for the real-time log display
- the colour of a System DB line when all the connected equipment are OK, but all the equipment composing the System DB are not selected

3.6.1.1 Log editor

There are two parameters for the log editor: LogEditor and LogEditorOptions. When Log/edit menu is activated, the following command is processed:

LogEditor log_file LogEditorOptions (for example: uedit32 log.csv /r)

Of course LogEditor is mandatory, if there's no option for this application set LogEditorOptions to "without". If LogEditor contains (a) blank character(s) it (they) must be surrounded with quotes, but in this case the log editor can't be a "*.bat" file.
3.6.1.2 Log file extension

The parameter **LogFileExtension** defines the extension of the log file. When activating Log/edit menu the content of the log file (Kernel file) is copied from PACiS SMT KERNEL to the directory `log` in the file `log.LogFileType`. Example: if LogFileType = csv, the file created will be `log.csv`.

3.6.1.3 Log display size

The parameter **LogDisplaySize** defines the maximum number of events used for real-time log display on PACiS SMT HMI. This display is managed in roll mode: once the number of received events is reached, each time a new event is received the oldest is deleted.

3.6.1.4 Incomplete equipment selection colour

When a System DB is the Current or the Standby one and when at least one of its equipment is connected, the line in the System database store is coloured. One particular case is if all the connected equipment are OK (good mode and DB version) but all the equipment of the DB have not been selected for connection by the operator; in this case the status of the DB can:

- be considered as OK (although one equipment is missing), then the colour should be green,
- be considered as there's one equipment not connected (although it will never be connected because it's not selected by the operator), then the colour should be yellow,
- be considered in this special state, then the colour should be blue.

The **DbPartialSelectionColor** parameter allows to define the colour:

- 1 for yellow,
- 2 for blue,
- 3 for green.

3.6.2 PACiS SMT Kernel

For PACiS SMT KERNEL can be tuned:

- The period of the IEC 61850 agency supervision
- The maximum size allowed for system configuration storage
- The storage location of disturbance files
- The location of disturbance converters
- The maximum size allowed for disturbance files storage
- The converters for disturbance file post-processing
- The definition of a remote folder in order to store all files managed by the SMT (log files, databases, disturbance files)
- The time-out value for equipment reconnection after an agency reconfiguration (*)
- The time-out value for disturbance event subscription/un-subscription (*)

(*) These parameters are optional, not present after installation, and should not be modified.

3.6.2.1 IEC 61850 agency supervision period

Set the parameter **HeartBeatPeriod** to the desired value, in milliseconds.
3.6.2.2 System configuration storage size

Set the parameter MaxSysDB to desired value, in Kbytes. This parameter corresponds to the maximum size allowed for unzipped system databags storage (only system databag file is unzipped by PACiS SMT, application Databags, eventually zipped, contained in the system databag file, are not unzipped by PACiS SMT).

Setting this value smaller than the space currently use on the disk will have no immediate effect, this new value will only be taken into account on next system databag storage.

3.6.2.3 Disturbance storage location

Parameter DisturbanceStoragePath indicates where disturbance files are stored (this directory is normally created during installation phase). On starting PACiS SMT KERNEL check if the directory exists, if not it tries to create it: in case of failure PACiS SMT KERNEL displays a message, and stops after user message acknowledgement.

3.6.2.4 Disturbance files storage size

Set the parameter MaxDisturbanceStorageSize to desired value, in Kbytes. This parameter corresponds to the maximum size allowed to store disturbance files in the directory given by DisturbanceStoragePath parameter.

Setting this value smaller than the space currently use on the disk will have no immediate effect, this new value will only be taken into account on next file storage.

3.6.2.5 Disturbance converters location

Parameter DisturbanceConvertersPath indicates where disturbance converters are stored (this directory is normally created during installation phase).

3.6.2.6 Disturbance file converters

For each disturbance files whose extension is d<xx>, with xx ∈ [00,99] a converter can be launched after the file has been uploaded.

There are 2 parameters for each converter: d<xx>FileConverter and d<xx>FileConverterOptions.

The following command is processed after a file uploading (if a converter is defined in “kernel.ini” file):

```
<absolute-path>\d<xx>FileConverter <absolute-path><IED name>_\.d<xx>
```

d<xx>FileConverterOptions

example: c:\PACiS\conv\conv1.exe "c:\program files\PACiS\smt\disturbance\1.0\calc1\IED2_4.d02" /r)

If there’s no converter for this type of file, set d<xx>FileConverter to without, or remove this line from “kernel.ini” file.

If d<xx>FileConverter contains a blank character(s) it must be surrounded with quotes, but in this case the converter can’t be a *.bat file.

If there’s no converter option set d<xx>FileConverterOptions to without, or remove this line from “kernel.ini” file.

Time-out value for equipment reconnection

Some request (Set Current on a system database for example) may involve an IEC 61850 agency reconfiguration: after the agency starting PACiS SMT KERNEL may have to restore some connections and to wait them to be fully established (GLOBE, DI, etc received) before continuing. There’s a time-out associated to this wait, it’s the parameter named connectionTimeOut and the unit is the millisecond. The default embedded value is 20 s, and the value given is not taken into account if it's smaller than 20 s.
Time-out value for disturbance event subscription/un-subscription

Starting or stopping disturbance event subscription on an equipment (on start/stop disturbance monitoring) uses asynchronous agency services, and then PACiS SMT KERNEL needs to wait the asynchronous call-backs. There's a time-out associated to this wait, it's the parameter named distTimeOut and the unit is the millisecond. The default embedded value is 15 s, and the value given is not taken into account if it's smaller than 15 s.

3.6.2.7 SMT Data Storage Root

The parameter SmtDataRoot is used to define a remote folder for storing all files managed by SMT (logs, databases, disturbance files).

Example:
SmtDataRoot=\10.22.186.122\pacis\smt_data_root (in case if diskless PC)

Or
SmtDataRoot=\GTW1\pacis\smt_data_root

3.6.2.8 DisturbanceAlternateStoragePath

This parameter DisturbanceAlternateStoragePath is used to define an additional storage path for the disturbance files. The disturbance files will be store in the default directory AND in this additional directory. This additional directory name may point to a remote PC identified by its IP address or a network name.

Example:
DisturbanceAlternateStoragePath = \PCLD533NT5\Disturbance

Where PCLD533NT5 is a remote PC network name and Disturbance a directory on this remote PC. The remote directory must be shared to allow the file transfer from the SMT PC to the remote PC.
3.7 Multilinguism

The basic installation is performed with English text labels (the labels are located in the "exe/lang" directory in "*.properties" files).

For setting another language:

- the "*.properties" files need to be translated into the required language,
- the "*.properties" file name must be suffixed by ISO Language Code (e.g. hmi_fr.properties). These codes are the lower-case, two-letter codes as defined by ISO-639. You can find a full list of these codes at a number of sites, such as: http://www.ics.uci.edu/pub/ietf/http/related/iso639.txt
- the local location must be tuned with the regional options according to the chosen code (e.g. "French(France)" for "fr" language code):

![FIGURE 12: REGIONAL OPTIONS]
FIGURE 13: LANGUAGE OPTIONS

NOTES: 1) The change of the language cannot be performed on line (i.e. PACiS SMT must be restarted to take into account the change of language)

2) The choice of the "properties" file is processed in the following order:
   - Search the "properties" file which is suffixed by the language code compliant with the locale location (e.g. "hmi_fr.properties" for the french locale.
   - Search the "properties" file which is not suffixed by any language code (e.g. "hmi.properties"

Example:

"Exe/lang" directory contains "hmi_fr.properties" (french text labels) and "hmi.properties" (english text labels). If the locale location is:

French: the menu items are displayed in french,

Not french (german, italian, english,..); the menu items are displayed in english.
3.8 Installation fault messages

Parameters entered by the user (such as ports, multicast address, etc) are checked. If the value is out of range or incorrect, a pop-up message is displayed (see example below) and the user has to give a correct value.

FIGURE 14: INSTALLATION FAULT MESSAGES
4. **UNINSTALLATION**

Uninstallation can only be performed from the Settings/Control panel/Add/remove programs panel.

**WARNING:** BE SURE THAT PACiS SMT KERNEL IS STOPPED BEFORE UNINSTALLATION.

**Caution:** “Uninstall PACiS SMT” or “Uninstall PACiS SMT HMI” only performs the removal of files created upon installation. All the files created later by using PACiS SMT are not deleted. So you may have to clear all the following residual files manually (the uninstall procedure gives the precise list of all the directories/files that were not cleared):

- `%SMT_DIR%/exportDB/*.*`
- `%SMT_DIR%/importDB/*.*`
- `%SMT_DIR%/log/*.*`
- `%SMT_DIR%/saveObject/db/*.*`
- `%SMT_DIR%/saveObject/log/*.*`
- `%SMT_DIR%/saveObject/options/*.*`
- `%SMT_DIR%/sbus/*.*`
- `%SMT_DIR%/traces/*.*`
- `%SMT_DIR%/exe/smt/*.*` (if patches have been installed)
- disturbance storage directory

In case of several installation at different locations, manual uninstallation of a previous release (not the last installed which can be uninstalled as described above), consists only in deleting all directories and files under the installation directory.
5. **CONFIGURATION IN SCE**

At the highest system level, tab General, enter the TCP/IP address of the computer hosting the SMT server:
6. APPENDIX

6.1 PACiS SMT KERNEL initialisation file

Example of Kernel.ini content:

```
[common]
KernelName=Kernel

1. SCOPE OF THE DOCUMENT

This document is a chapter of the PACiS SMT manual. It describes the User Interface (coded HMI for Human Machine Interface) of this software application: the PACiS SMT HMI.
2. PACiS SMT HMI

2.1 Launching Application

After a successful installation of SMT Kernel and SMT Hmi the two related icons are present on desktop.

2.1.1 Launching SMT Kernel

As any Windows program the SMT Kernel can be launched with various ways:

- Double-click the **PACiS SMT Kernel** icon
- Click the "start" button (in the left-bottom corner of the screen) then select **Programs / PACiS / SMT / SMT Kernel**

Then the icon (1) is displayed in the right-bottom corner of the screen indicating that the SMT kernel is running.

---

**FIGURE 1: SMT ICONS**

It is mandatory to launch first PACiS SMT Kernel before launching PACiS SMT Hmi.

**FIGURE 2: RUNNING SBUS AGENCY AND SMT KERNEL ICONS**
2.1.2 Setting passwords

The SMT has 4 profiles protected by password so 4 roles predefined. For each profile is associated with a set of SMT functions described as following:

<table>
<thead>
<tr>
<th>SMT function authorized</th>
<th>Corresponding profile</th>
</tr>
</thead>
<tbody>
<tr>
<td>Change password and set-up</td>
<td>Security administrator</td>
</tr>
<tr>
<td>Visualize security logs</td>
<td></td>
</tr>
<tr>
<td>Install a new database</td>
<td>System administrator</td>
</tr>
<tr>
<td>Switch of database</td>
<td></td>
</tr>
<tr>
<td>SMT kernel administration (configure, view traces, change trace option)</td>
<td></td>
</tr>
<tr>
<td>Download ICD</td>
<td>System engineer</td>
</tr>
<tr>
<td>Change operating mode</td>
<td>System administrator</td>
</tr>
<tr>
<td>Activate/deactivate disturbance monitoring</td>
<td></td>
</tr>
<tr>
<td>Display list of computer</td>
<td>Observer</td>
</tr>
<tr>
<td>Start CMT (not applicable for CAT)</td>
<td>system engineer</td>
</tr>
<tr>
<td>Display operating mode</td>
<td>System administrator</td>
</tr>
<tr>
<td>Display DB version</td>
<td></td>
</tr>
</tbody>
</table>

To one profile corresponds only one login / password. The login / password define the menu reachable.

The password length could be extended to 8 digits. The password is a NERC compliance with the following rules:

- Password has at least six characters in length.
- Contain characters of the following four categories:
  - 26 Upper case characters [A-Z]
  - 26 Lower case characters [a-z]
  - Base 10 digits (0-9)
  - Non-alphanumeric
- At least one character of each category with Non-alphanumeric char are:

```
! " # $ % & ' ( ) * + , - . / : ; < = > ? @ [ \ ] ^ _ ` 
```
The password creation is defined as following:

For the first using, after SMT installation, the user has to define password per profile:

- By right-clicking the **PACiS SMT kernel** icon, a contextual menu with the following items is displayed:
By clicking **Set password**, the authentication window is displayed with the login (Security administrator) and password.

### FIGURE 4: THE SMT AUTHENTICATION WINDOW

**NOTE:** The default password for the Security administrator is the computer’s hostname. For example: Hostname is MYCOMPUTER123, The password will be: MYCOMPUTER123. The other accounts don’t have any password, and you can’t log in until the security administrator has set a password.

If password success, the SMT Authentication settings window is displayed:

### FIGURE 5: THE SMT AUTHENTICATION SETTING WINDOW

**NOTE:** LogIn settings are common for all profiles.

The user (Security administrator) has to set password properties for each 3 other profiles defined on list:

### FIGURE 6: THE SMT AUTHENTICATION SETTING WINDOW PROFILE LIST
By clicking **Change… button, the new password is edited**:

![Password Entry Window](image1.png)

**FIGURE 7: THE SMT DEFINE PASSWORD WINDOW**

The password is changed with the displaying of the information window:

![Password Confirmation Window](image2.png)

**FIGURE 8: THE SMT DEFINE PASSWORD CONFIRMATION WINDOW**

### 2.1.3 Launching SMT HMI

It is mandatory to launch first PACiS SMT Kernel before launching PACiS SMT HMI.

The SMT HMI can be launched with various ways:

- Double-click the PACiS SMT Hmi icon
- Click the "start" button (in the left-bottom corner of the screen) then select Programs / Pacis / SMT / SMT Hmi

- From the OI application click the SMT icon in the Tool banner (refer to chapter Human Interface of the OI Technical Guide).
A disclaimer popup is launched. The user must press the 'I agree' button to proceed to the next stage. Pressing 'I disagree' will cause the user to exit the program.

![Disclaimer popup](image)

**FIGURE 9: THE SMT DISCLAIMER POPUP**

Then a login window is displayed and the user must enter a password with the login (profile) choised:

![Authentication](image)

**FIGURE 10: THE SMT LOGIN WINDOW**

**Login**: [Observer / System engineer / System administrator] is the profile.

**Enter password**: password associated with the login (define on previous section Setting passwords). All password / profile have to be defined by the Security administrator, else the login is refused.

Once the password has been validated (by clicking the "OK" button), it is compared to the profile password. If the password is correct, and no other profile is currently logged, the user will be logged as profile.

If the password is not correct, the logging is refused, and the user has to try again.
2.1.4 Exit menu

The Exit menu is always available. A warning box asking to confirm this action is displayed.

![FIGURE 11: THE EXIT MENU AND ASSOCIATED WARNING BOX](image)

2.1.5 Databases menu

The Databases menu is only available when the Databases panel is selected.

![FIGURE 12: THE DATABASES MENU](image)

The items of this menu are:

- **Add Database** (Administrator only): this action is available from everywhere in the database list, even if there's no selected line.

- **Delete database** (Administrator only): this action is not available if the corresponding database is the Current or Standby one.

- **Connect all equipment** and **Disconnect all equipment** (Administrator or Observer): these actions apply only to all the equipment included in the selected System database. A pop-up is displayed if a disturbance file upload is running, explaining that the execution of the request will be delayed. During the request the corresponding line in the table blinks. These requests are blocking: the user can't do anything else until the request is finished (finished means that the connection is requested by the SBUS agency to the remote IEC 61850 equipment, but not that the remote equipment is really connected).
• **Set current** (Administrator only): this action is not available if the corresponding database is not the Standby one. If no equipment is selected, it just defines this database as the reference (the status bar is then updated). If at least one piece of equipment is selected, it implies a switch database order and a change operating mode order (= go to Run) for all the connected equipment for which it's necessary. A pop-up is displayed if a disturbance file upload is running, explaining that the execution of the request will be delayed. Agency is reconfigured if its current configuration is not the future Current database one. This command does not impact non-PACiS devices.

• **Set/Download standby** (Administrator only): this action is not available if the corresponding database is the Current one. If no equipment is selected, it just defines this database as the reference (the status bar is then updated). If at least one piece of equipment is selected, it implies the configuration downloading for all the connected equipment for which it’s necessary. A pop-up is displayed if a disturbance file upload is running, explaining that the execution of the request will be delayed. This command does not impact non-PACiS devices.

• **Connect**: this action is available as long as all selected database equipment are not selected for connection, with the right IP address (i.e. if an equipment is currently connected with an IP address different from its address in the selected database), or on Administrator if disturbance monitoring status is Standby and the selected database is the Current one and the agency configuration is not equal to the Current System database one (this to allow to reconfigure the agency, which allows disturbance monitoring to "restart"). This action is also available if at least one equipment of the selected database has diag or iedDiag(s) data different from the one available in the current agency configuration (this to allow to reconfigure the agency in order to be able to see the diag(s) and iedDiag(s) data defined in the selected database). When the user has Administrator rights, if the connection of all the equipment involves a reconfiguration of the IEC 61850 agency (means one IP address to connect is not available in the current agency configuration), a pop-up window explaining this will be displayed, asking a confirmation. When the user has Observer rights, only the equipment, which belongs to the IEC 61850 agency configuration, will be connected.

• **Disconnect**: this action is available as long as at least one piece of equipment of the selected database is selected for connection.

• **Abort all the on going requests**:

  NOTE: These items can be accessed too from the contextual menu displayed by right-clicking on line of the System databases store table.

### 2.1.6 Disturbance menu

The Disturbance menu is only available when the Databases panel is selected.

#### FIGURE 13: THE DISTURBANCE MENU

This menu has two items only available on administrator.

• **Disturbance on (off)** (shortcut: Ctrl + Alt + M): this action is available only if a current database exists. It allows starting or stopping the disturbance file upload, for all the chosen equipment of the database. This item is available, and the associated action taken into account even if no equipment of the database is selected for connection. Disturbance on involves an agency reconfiguration if its current configuration is not the one of the System Current database.
Choose equipment (shortcut: Ctrl + Alt + I): this action is available if the selected database has equipment, which generates disturbance files. It displays the list of devices (IEC 61850 equipment or IED managed by this equipment) of the database which are able to produce disturbance files, and the user can select it or not (selected means SMT will listen to disturbance event of this device). The selection is immediately taken into account (but will have no immediate effect if the selected database is not the current one and disturbance function is not activated on this database). By default all devices are selected.

If disturbance bricks are redundant:

- the IED appears twice in the tree for each IEC 61850 server,
- the name of these IEDs is suffixed with a star (*),
- the name of the main IEC 61850 server is suffixed with a star (*),
- for the main server node, the name of the backup IEC 61850 server appears below the legacy bus nodes,
- for the backup server node, the name of the main IEC 61850 server appears below the legacy bus nodes.

The pop-up displayed at the end of each request (except disturbance stopping) indicates if starting disturbance monitoring has failed on some equipment: this means disturbance event is not monitored on these equipment (although device is ticked if the <choose equipment> list). If starting disturbance monitoring has failed it probably means at configuration problem in PACiS SMT or in the equipment. Stopping disturbance (globally or on a particular equipment) always succeed from PACiS SMT point of view (protocol failure if exists doesn’t prevent PACiS SMT to stop monitoring the device).

If disturbance is on, and the agency configuration is not equal to the Current System database one then disturbance status indicated in the status bar is "standby", which means disturbance events are not monitored. If a request leads to an agency reconfiguration with the Current System database agency configuration, disturbance monitoring will restart, and status indicated in the status bar will be "on".

FIGURE 14: THE "CHOOSE EQUIPMENT" MENU
2.1.7 Equipment menu

The Equipment menu is only available when the Equipment tab is selected.

This menu has the following items:

- **Switch** (Administrator only): this action implies a switch database order for the selected application(s).
- **Switch all equipment** (Administrator only): this action is applied to all equipment, among all equipment selected for connection, for which it is possible.
- **Download / Stand-by** (Administrator only): this action is available only if a "Standby" database has been selected in the System databases store list. It implies a configuration downloading for the selected application(s).
- **Download / Other...** (Administrator only): this action opens a dialog box which allows the user to select a database, among all the databases in which the application appears. Once a database is chosen, it implies a configuration downloading for the selected application(s).
- **Download all equipment / Stand-by** (Administrator only): this action is applied to all equipment, among all equipment selected for connection, for which it is possible.
- **Download all equipment / Other...** (Administrator only): this action opens a dialog box which allows the user to select a database, among all the databases in which the application appears. Once a database is chosen, downloading is performed, among all equipment selected for connection, for which it is possible.
- **Upload / Stand-by** and **Upload / Current** (Administrator only): these actions are available if only one application is selected in the table. A dialog box is then displayed which allows to choose the destination of the uploaded file.
- **Set Maintenance** (Administrator only): this action is available for C264 only and also if the equipment is already in Operational mode or in Test mode. When available this action implies a change operating mode order for the selected equipment.
- **Set Operational** (Administrator only): this action is available if the equipment is already in Maintenance mode. It implies a change operating mode order for the selected equipment.
- **Set Test** (Administrator only): this action is not available for C264 only and also if the equipment is already in Operational mode. It implies a change operating mode order for the selected equipment.

- **Set all equipment in Maintenance** (Administrator only): this action is applied on all equipment which are not in Maintenance mode, whether they are selected or not. This action is not available for GTW-PC and OI.

- **Set all equipment in Operational** (Administrator only): this action is applied on all equipment which are in Maintenance mode, whether they are selected or not.

- **Set all equipment in Test** (Administrator only): this action is applied on all C264 equipment which are in Operating mode, whether they are selected or not.

- **Collapse Tree**:

- **Expand Tree**:

- **Download IEC61850 IEDs CID**: The SMT can launch from contextual menu in the equipment view the MiCOM S1 Studio with the targeted IED in parameter, in order to have a direct connection between the MiCOM S1 and the IED. This facility is available for IEC61850 IEDs.

- **Abort all the on going requests**:

  NOTES:  
  1. These items can be accessed too from the contextual menu that is displayed by right-clicking on an equipment in the **Equipment** tab.

  2. An observer is informed of an application on-going request (switching, changing operating mode, downloading, uploading), he can see the corresponding line blinking.

  3. For all the requests, the end is signalled by a pop-up window that the user has to acknowledge (the end means that PACiS SMT HMI has sent all the mandatory requests to the IEC 61850 Agency and received the synchronous acknowledgement, but has not wait the complete result on the remote equipment). This pop-up window signals the success of the request, or the list of equipment on which the request has failed.

  4. A request can be refused if the IEC 61850 agency is not OK.

2.1.8 **Log menu**

The **Log** menu has one sub-menu:

![FIGURE 16: THE "LOG" MENU](image)

- **Kernel**: this sub-menu has two items:

  - **Edit** (shortcut Ctrl + E): the log file can be opened with a text editor (default editor is Notepad) and can be printed. The content of the file is the content corresponding to the moment of the **Edit** command; it is not updated in real time. If the user wants to see if the file has been modified ten minutes later, for example, he has to close the file, and to edit it once again
- **Display** (shortcut Ctrl + L): each new entry (event which occurs after the Display command time) is printed in a list view, the lines scroll towards the top of the window at each new event, the lowest line of the list being the more recent one. This list is displayed in a dedicated window that can be iconified.

**NOTE:** The log edit and log display files are in the same language as PACIS SMT HMI.

### 2.1.9 Time menu

The **Time** menu has a unique item: **Set...** The related dialog box shows the current system date/time. You can modify any field. The current time shows in the status bar. It refreshes every two seconds. If there is no Current system database defined, then this menu item is not available.

![FIGURE 17: THE "TIME" MENU AND RELATED DIALOG BOX](image)

### 2.1.10 Options menu

The **Options** menu has two items. The associated dialog boxes allow to configure kernel options and browser options.

![FIGURE 18: CONFIGURATION OF KERNEL OPTIONS](image)
For the configuration of kernel options the user can choose the following options (a selected check box means **yes**, a cleared check box means **no**):

- **Always confirm before execution**: the default value is **yes**. Each modification is immediately taken into account, and backed-up on the disk. This option applies only to the concerned PACiS SMT HMI.

- **Display complete log**: the default value is **yes**. This option is used to filter the events for the log display *(not for the log edit)*: yes means that all the log events will be displayed, no means that only the events concerning our connected equipment will be displayed (plus general events as IEC 61850 agency loss, Set Current request, etc). Each modification is immediately taken into account and backed-up on the disk. This option applies only to the concerned PACiS SMT HMI.

- **Always download the ApplicationDataBag** *(Administrator only)*: the default value is **no**. Each modification is immediately taken into account, and backed-up on the disk. This option is used to force the downloading of the ApplicationDataBag, even if the application Vdbs is the same as the System Vdbs (it can be seen as the equivalent of the “rebuild all” option for a compiler, it’s useful if some IEC 61850 equipment were previously loaded with configuration of an other system which could have the same Vdbs, but not the good ApplicationDataBag).

- **Automatic disturbance starting** *(Administrator only)*: the default value is **yes**. This option is used to decide if the automatic disturbance file upload is activated automatically on a database when this one becomes the Current one.

- **Keep previous disturbance equipment selection** *(Administrator only)*: the default value is **no**. This option is used to decide if, when a database becomes the Current one, selected equipment is that previously defined with the <Choose equipment> menu, or are the same as the current database (as much as possible).

- **Log event number** *(Administrator only)*: the maximum number of events to store in the log file. The default value is 1000. Each modification is immediately taken into account.

- **Agency Services** C/C++ C SMT calls to agency services, and callbacks are now visible in a “dbwin” window (as PACiS OI for example). The name of this debug window has to be defined in the key value “HKEY_LOCAL_MACHINE/Software/Smt/dbWinName”. This key is not defined after an installation, it must be added manually. If this value is not defined, or its content is empty, debug traces are not activated. The content of this value should be “dbwin”.

### 2.1.11 CMT menu

The CMT/Start menu launches the CMT application

![System Management Tool - Administrator](image)

**FIGURE 19: THE CMT MENU**
2.2 Databases display

The **Databases** are shown when the corresponding tab is selected. Two tables are mainly displayed:

- the **System databases store** table
- the **Equipment definition** table

![FIGURE 20: THE DATABASES DISPLAY](image)

When a line is selected:

- The border of the line is black,
- The colour of the line is darkened.

2.2.1 System databases store table

The **System database store** table displays the following information about the available SystemDataBag:

- Version (static information)
- Version date (static information)
- Name (static information)
- Version comment (static information)
- Current flag (dynamic information, set by the Set Current action)
- Standby flag (dynamic information, set by the Set Standby action)

The following state chart shows the possible statuses of a SystemDataBag.
A click on one of these six fields of a table line selects the line. The <current> (<standby>) toggles are ticked if:

- they were not ticked and the user requests a <Set current> (<Set/download standby>) action,
- they were ticked when the SMT was stopped.

The colour of the line can be:

- **White:**
  - The database is not the Current nor the Standby one,
  - The database is the Current or the Standby one and no equipment is selected,
- **Grey:** connection with IEC 61850 agency is not available,
- **Green:**
  - For Current: all PACiS equipment of the system are connected, have the good <current> Vdbs (i.e. the same one as the System database) and are in Operational (run) mode, and all non PACiS equipment are connected
  - For Standby: all PACiS equipment of the system are connected and have the good <standby> Vdbs (i.e. the same one as the System database), and all non PACiS equipment are connected
- **Yellow:**
  - For current: all equipment of the system are selected for connection, at least one is not responding, and all responding PACiS equipment have the good <current> (<standby>) Vdbs (i.e. the same one as the System database) and are in Operational (run) mode,
  - For Standby: all equipment of the system are selected for connection, at least one is not responding, and all responding PACiS equipment have the good <current> (<standby>) Vdbs (i.e. the same one as the System database),
• **Red:**
  - For current: at least one of the connected equipment has an incorrect Vdbs, or is not in Operational (run) mode,
  - For Standby: at least one of the connected equipment has an incorrect Vdbs,

• **Blue:** this colour can be modified and set to yellow or green in HMI initialisation file
  - For Current: all the selected for connection PACiS equipment of the system are connected, have the good <current> Vdbs (i.e. the same one as the System database) and are in Operational (run) mode, and all non PACiS equipment are connected, but not all the equipment of the system are selected for connection,
  - For Standby: all the selected for connection equipment of the system are connected and have the good <standby> Vdbs (i.e. the same one as the System database), and all non PACiS equipment are connected, but not all the equipment of the system are selected for connection,

• **Blinking:** a <Set current> (<Set/download standby>) or Connect all/Disconnect all request is on going.

**NOTE:** The colour of the line is updated according to the results of any user requests, the equipment behaviour (disconnected, etc…) and the IEC 61850 agency status.

2.2.2 Equipment definition table

The **Equipment definition** table displays equipment parameters and the user connection choice:

- **Name** (static information)
- **IP address** (static information)
- **Connection requested** (dynamic information, set by the <Connect> or <Disconnect> user action)

The content of this table depends on the filter value:

<table>
<thead>
<tr>
<th>Filter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>selected DB</td>
<td>the content of the table is the list of the equipment composing the database selected in the System databases store table.</td>
</tr>
<tr>
<td>all selected eqt in all DB</td>
<td>the content of the table is the list of all selected equipment. The IP address displayed is the current one (the one available in the IEC 61850 Agency configuration).</td>
</tr>
<tr>
<td>selected eqt. for the selected DB</td>
<td>The content of the table is the list of selected equipment which belongs to the database selected in the System databases store table.</td>
</tr>
<tr>
<td>not selected eqt. for the selected DB</td>
<td>the content of the table is the list of the not selected equipment which belong to the database selected in the System databases store table.</td>
</tr>
</tbody>
</table>
For an Administrator, if the IP address field is **red**, it means:

- for a connected equipment, that the equipment is no more available (it was connected before with this IP address but not now), or that the equipment is still connected but not with this IP address,
- for a not connected equipment, that this equipment is not available in the current IEC 61850 agency configuration.

For an Administrator, if the line is **grey** and IEC 61850 agency is OK, it means:

- for a connected equipment, that the equipment is not available in the current IEC 61850 agency configuration. This is only possible with filter set to "All selected equipment in all DB".

For an Observer, if the line is **grey** and IEC 61850 agency is OK, it means:

- for a connected equipment, that the equipment is no more available (it was connected before with this IP address but not now), or that the equipment is still connected but not with this IP address,
- for a not connected equipment, that this equipment is not available in the current IEC 61850 agency configuration.

If the IEC 61850 agency is not available, all the lines of the table are **grey**.

The following actions based upon the selected equipment can be initiated from the Databases menu of the menu bar or from the contextual menu (right click on the selected line), with the restrictions listed below:

- **Connect** (Administrator or Observer): this action is available on Administrator if an equipment is currently connected with an IP address different from its address in the selected database (the IP address colour is then red) or if disturbance monitoring is Standby and the selected equipment belongs to the Current database (Current System database selected in the System Database store table) and the agency configuration is not equal to the Current System database one (this to allow to reconfigure the agency, which allows disturbance monitoring to "restart"). <Connect> is also available if equipment has diag or iedDiag(s) data different from the one available in the current agency configuration (this to allow to reconfigure the agency in order to be able to see the diag(s) and iedDiag(s) data defined in the selected database for the equipment). Connect is not available if the line is grey on an Observer. A pop-up is displayed if a disturbance file upload is running, explaining that the execution of the request will be delayed.

- **Disconnect** (Administrator or Observer): this action is always available for a connected equipment, except in case of SBUS agency failure. A pop-up is displayed if a disturbance file upload is running, explaining that the execution of the request will be delayed.

**NOTES:**

1. It is possible to select several lines, but actions will be available according to the conditions listed above. In this case, if a confirmation has been requested, a global confirmation is available.

2. A request can be refused if the IEC 61850 agency is not OK.

3. Once <Connect> has been chosen, the <Connection requested> toggle is ticked (empty if <Disconnect>), whatever the real result is. The real status of the connection is available in the Equipment panel.

4. During the request the corresponding line(s) in the table blink. The connect/disconnect requests are blocking; the user can’t do anything else until they are finished (finished means that the connection/disconnection is requested by the IEC 61850 agency to the remote IEC 61850 equipment, but not that the remote equipment is really connected/disconnected).
2.3 Equipment panel

2.3.1 PACiS devices

The **Equipment** panel appears when the corresponding tabbed panel is selected; it contains the tree view of the status of each piece of equipment selected for connection.

If a global request has been previously issued (from the **Databases** panel, for example **Set/download standby**), this tree is updated with the results of the successive requests. In the same way, after each request on this tree the **Databases** panel is updated.

When a node in the tree is selected, the relevant equipment name appears in the contextual help field, and the equipment node changes:

- the colour of the node text becomes white,
- The background colour of the node is darkened.

2.3.1.1 Selected equipment status tree view

The tree view displays the following data:

- **Identity** extracted from “DI” brick including:
  - Model,
  - Serial Number (from “Vendor Identity”),
  - Hardware Version (from “Vendor Identity”),
  - Software Version (from “Vendor Identity”),
  - System Version (from “Communication Identity”),
- Databases including Standby and current versions, which are updated upon change; if the database has been modified within the equipment (ON line modification), a star appears behind the version.
- **Mode** which is updated upon change,
- **Hardware** (may not exist) including all the data points which are contained in the “DIAG” brick: the value of a data point is converted from a numeric value to a text value according to diag labels which are provided by the system databag,
- **Fieldbus** (may not exist) including all the IEDs, which are connected over a legacy bus. A colour is attached to each IED according to “CommSt” data extracted from “IEDDiag” brick:
  - “green”: the IED is reachable through the legacy bus,
  - “red”: the IED is not reachable through the legacy bus.

The following displayed items:
- Root node name,
- Hardware and Fieldbus nodes,

are connected with the equipment diag and iedDiag(s) brick(s) description of the system databag with which the agency is configured.

**Example**: in system databag 1.0, appA has IED1, in system databag 2.0 appA has IED 1 and IED2. If PACiS SMT agency configuration is 1.0, only IED1 will appear in tree-view, if PACiS SMT agency configuration is 2.0 IED1 and IED2 will appear in tree-view. According to the equipment current configuration these nodes may be reachable or not: if they are not reachable hardware is present, but has no child node, and IED names are present but are in white.

If no diag brick is defined for a device (in the system databag), then the tree does not contain a “hardware” node for this device.

Also, if no fieldbus is defined (in the system databag), then the tree does not contain a “fieldbus” node for this device.

Recall: Current and Stand-by Database version are System Database Version and not an application version. Application version doesn’t exist inside PACiS SMT HMI.

The colour convention of the node label is:
- **Grey**: connection with IEC 61850 agency is not available, or the device is not available in the current agency configuration.
- **White, without child node**: the device can’t be reached (PACiS SMT HMI continuously attempts to connect) but the IEC 61850 agency is OK.
- **White**: the application is connected, but no Current and Standby System database are defined, or the application does not belong neither to the Current nor to the Standby System database.
- **Blinking**: a downloading database, switching database or change operating mode request is on-going on this application,
- **Green**:
  - Current and Standby System Vdbs are defined:
  - the application current Vdbs is the same as the system current Vdbs, the application standby Vdbs is the same as the system standby Vdbs and the application is in Operational (Run) mode,
  - Only Standby System Vdbs is defined:
  - the application standby Vdbs is the same as the system standby Vdbs,
  - Only Current System Vdbs is defined:
  - the application current Vdbs is the same as the system current Vdbs and the application is in Operational (Run) mode.
• Red:
  − The application is in Faulty mode
  − Current and Standby System Vdbs are defined:
    − the application current Vdbs is not the same as the system current Vdbs, or the application standby Vdbs is not the same as the system standby Vdbs, or the application is not in Operational (Run) mode (Maintenance, Test or Faulty),
  − Only Standby System Vdbs is defined:
    − the application standby Vdbs is not the same as the system standby Vdbs,
  − Only Current System Vdbs is defined:
    − the application current Vdbs is not the same as the system current Vdbs or the application is not in Operational (Run) mode

2.3.1.2 Tree icons

• Equipment node: two different icons can be defined by user, to indicate if an application is reachable or not (1 for reachable, 1 for not reachable)

• All other nodes: each node can have its own icon which is defined by the user with the "<SMT installation dir>/exe/images/EqptStatus/icon.properties" file.

If the selected “equipment” node is Grey, White without child node or Red, the help field of the status bar displays a short textual information which give some precision about the problem/status.

2.3.1.3 Contextual menu

![System Management Tool - Administrator](image)

**FIGURE 24: THE “CONTEXTUAL” MENU**

It is possible to select several lines, only the equipment that is in the good mode will be concerned by the request. In this case, if a confirmation has been requested, a global confirmation is available. For all the requests, when selected, a pop-up is displayed if a disturbance file upload is running, explaining that the execution of the request will be delayed.
2.3.2 Non PACiS devices

2.3.2.1 Selected equipment status tree view

The tree view displays the following data:

- **Identity**: only “name”, “Serial number” and “Hardware version” are displayed,
- **Mode**.

If one of these data does not exist for a device, the node is displayed with no attached value.

The colour convention of the node label is:

- **Grey**: connection with IEC 61850 agency is not available, or the device is not available in the current agency configuration.
- **White, without child node**: the device can’t be reached (PACiS SMT HMI continuously attempts to connect) but the IEC 61850 agency is OK,
- **White**: the application is connected, but no Current and Standby System database are defined, or the application does not belong neither to the Current nor to the Standby System database.
- **Green**:
  - Current and Standby System Vdbs are defined: the application is in Operational (Run) mode if mode is available, or mode is not available and application belongs to the Current and/or to the Standby system database,
  - Only Standby System Vdbs is defined: application belongs to the Standby system database,
  - Only Current System Vdbs is defined: the application is in Operational (Run) mode if mode is available, or mode is not available and application belongs to the Current system database.
- **Red**:
  - The application is in Faulty mode,
  - Current System Vdbs is defined: if mode is available and is not Operational (Run) mode and application belongs to the Current system database.

2.3.2.2 Contextual menu

All the menu items are not enabled (except collapse and expand) because:

- its operating mode cannot be changed (mode control is a PACiS implementation),
- its configuration cannot be managed from PACiS SMT.

If the operator selects both PACiS devices and non-PACiS devices, the command does not impact non-PACiS devices.
2.4 Log printing interface

2.4.1 Log display

The log display window appears as follows:

![Log Display Window](image)

FIGURE 25: THE "LOG DISPLAY" WINDOW

The title indicates if all events are displayed (complete log), or only those concerning the connected applications (my log).

The user can clear the window with the Clear button, freeze or resume the display with the Freeze/Resume button.

A message is displayed if the freezing has been too long and then events have been lost.

2.4.2 Log description

The log file is managed in roll mode (when the maximum number of event is reached, the oldest event is replaced by the current one). The last event is in the last line of the file.

The format of a line is:

\{date\} ; \{user name\} ; \{equipment name\} ; \{user request/request status\} ; \{event\}

A line is always composed of this five columns, if a field is not relevant for the event it is empty.

with:

\{date\}: date of the event.

\{user name\}: user name, can be:

- IP address or name (for observer),
- ADMIN – IP address or name (for administrator),
- KERNEL.

\{equipment name\}: equipment name,
{user request/request status}: can be:

- User request:
  - ADD DB xx.yy, xx.yy is the Vdbs,
  - DELETE DB xx.yy, xx.yy is the Vdbs,
  - CONNECT,
  - DISCONNECT,
  - SET CURRENT xx.yy, xx.yy being the Vdbs,
  - SET/DOWNLOAD STANDBY xx.yy, xx.yy being the Vdbs,
  - DOWNLOAD xx.yy, xx.yy being the Vdbs,
  - UPLOAD CURRENT,
  - UPLOAD STANDBY,
  - SWITCH DB,
  - RUN, for a Run order,
  - MAINTENANCE, for a Maintenance order,
  - TEST, for a Test order,
  - SET TIME xxxx, xxxx being the date/time,
  - SET LOG SIZE,
  - CONFIG AGENCY STARTED,
  - SET DISTURBANCE MONITORING ON,
  - SET DISTURBANCE MONITORING OFF,
  - ENABLE DISTURBANCE MONITORING IN DB xx.yy, xx.yy being the Vdbs,
  - DISABLE DISTURBANCE MONITORING IN DB xx.yy, xx.yy being the Vdbs,
  - START DISTURBANCE MONITORING (always followed by a failure reason),
  - DISTURBANCE MONITORING STARTED,
  - DISTURBANCE MONITORING STOPPED,
  - UPLOAD DISTURBANCE FILE xxx, xxx being the file name,
  - DISTURBANCE FILE CONVERSION STARTED ON xxx, xxx being the disturbance file name,
  - DELETE DISTURBANCE FILE xxx,
  - SET DISTURBANCE MONITORING STARTING TO MANUAL,
  - SET DISTURBANCE MONITORING STARTING TO AUTOMATIC,
  - KEEP CURRENT EQUIPMENT SELECTION ON DISTURBANCE MONITORING STARTING,
  - IGNORE CURRENT EQUIPMENT SELECTION ON DISTURBANCE MONITORING STARTING
  - ENABLE DISTURBANCE MONITORING IN DB xx.yy, xx.yy being the Vdbs (enabling disturbance monitoring on an equipment)
  - DISABLE DISTURBANCE MONITORING IN DB xx.yy, xx.yy being the Vdbs (disabling disturbance monitoring on an equipment)
• User request status:
  − ENDED, only for SET CURRENT, SET/DOWNLOAD STANDBY or SET DISTURBANCE MONITORING xx requests,
  − SUCCESSFUL, for each equipment request, except CONNECT and DISTURBANCE FILE CONVERSION STARTED ON xxx,
  − FAILURE: reason of failure, for each equipment request, except CONNECT,
  − CONFIG AGENCY xx.yy SUCCESSFUL, where xx.yy is the System Vdbs.

{event}: can be:

• A Kernel event:
  − KERNEL START-UP,
  − KERNEL EXIT,
  − PASSWORD CHANGE.

• A user log in/log out event:
  − LOG IN,
  − LOG OUT, in this case all the following equipment disconnection are not recorded in the log file,
  − DISAPPEARANCE, when the user disappears without a log out request,

• An equipment event:
  − CONNECTED,
  − DISCONNECTED, on a volunteer user disconnection, or on a user disappearance (Log out or disappearance),
  − xx.yy STANDBY, when Stand-by Vdbs is modified (xx.yy = new Stand-by Vdbs),
  − xx.yy CURRENT when Current Vdbs is modified (xx.yy = new Current Vdbs),
  − RUNNING, when Mode has just switched to Run,
  − IN MAINTENANCE, when Mode has just switched to Maintenance,
  − IN TEST, when Mode has just switched to Test,
  − FAULTY, when Mode has just switched to Faulty,
  − DISTURBANCE FILE(S) TO UPLOAD, when a new disturbance file is available,
  − DISTURBANCE FILE UPLOAD xxx SUCCESSFUL or FAILURE, xxx being the file name.

• An IEC 61850 agency event:
  − SBUS agency has disappeared, when connection with equipment disappears – note that when an IEC 61850 agency failure occurs the following equipment disconnections are not recorded in the log file,
  − SBUS agency is coming back, when agency becomes available again.

There’s no global report for the connect/disconnect all, but all the elementary sequences will be recorded (in the log file will appear as many Connect requests as concerned applications).

All the fields are left aligned, they are separated by space-comma-space, and then Excel can easily process them for example.
2.5  Disturbance and waveform files

For a given device, once the file is read in the IEC 61850 equipment it is stored in a file called `<device_name>_yyymmdd_hhmmss.xx`, where `xx ∈ [00,99]` (but COMTRADE files are suffixed by ".dat" and ".cfg" extensions): a maximum of 10 files can be stored per device. These files are stored in the directory `<DisturbanceStoragePath>/DB<Vdbs>/device name>/<IED name>`.  

NOTE: If the device generates itself disturbance files, then the `<IED name>` sub-directory does not exist.

The default `DisturbanceStoragePath` value is `<SMT installation dir>/disturbance` (can be modified in `kernel.ini` file). The maximum space available for storage in `<DisturbanceStoragePath>` is defined by the parameter `MaxDisturbanceStorageSize` in the `kernel.ini` file.

If specified in `kernel.ini` file, a special processing can be launched on a given file type once a file is created (PACiS SMT HMI responsibility is then only to launch the processing).

A storage policy is defined to avoid filling up the hard disk:

- this principle defines a storage area per DB.
- when disk space used in `DisturbanceStoragePath` reaches `maxDisturbanceStorageSize` the oldest DB record storage area is recursively deleted. It is under responsibility of maintenance people to make previous storage on other support. If only current DB remains, the two oldest files of each device directory are automatically deleted.

Each file upload, hard disk file creation or deletion is logged.

2.5.1  Behaviour of Choose equipment menu with disturbance options

- Default behaviour: when a database becomes the Current one disturbance function is automatically activated, on all devices.
- `Keep previous disturbance equipment selection` to false: if a selection of device has been done previously with the Choose equipment menu on a database, when this one becomes the Current one, disturbance function is automatically activated on selected devices.
- `Keep previous disturbance equipment selection` to true: supposing DB 1.0 is Current and only devices A and B are selected for disturbance, DB 2.0 is Standby and devices A, B and C are selected for disturbance - when 2.0 will become Current disturbance function will be activated only on A and B (and only A and B will appear selected in the Choose menu dialog box).
SETTINGS
# CONTENT

1. SCOPE OF THE DOCUMENT 3  
2. CONFIGURATION FILES 4  
3. REGISTRY KEYS 5
1. SCOPE OF THE DOCUMENT

This document is a chapter of the PACiS SMT documentation. It describes the Settings which can modify the behaviour this product.

The setting is done through modifying configuration files or setting keys in the registry.

This chapter defines settings with default value setting at the installation time. But also shows which settings to modify for obtaining typical use case of the application.
2. CONFIGURATION FILES

Configuration files kernel.ini and hmi.ini are described in chapter Installation (SMT/EN IN) of this documentation.
3. **REGISTRY KEYS**

   The installation procedure sets the registry keys.
   
   They are described in chapter Maintenance (SMT MF/EN IN) of this documentation.
LOGICAL DIAGRAMS

   2.4 Uploading mode orders  
   2.5 Uploading of a disturbance file  
   2.6 Configuration of MiCOM IEDs
1. SCOPE OF THE DOCUMENT

This document is a chapter of the PACiS SMT manual. It describes the Logical functions and automations (encoded LG for Logic Diagrams) of this software application.

For further details concerning the configuration of functions, refer to the PACiS SMT AP chapter.
2. PLANT DATA INTERFACE

2.1 Connecting an IEC 61850 server

The following state diagram shows the life cycle of a session established by PACiS SMT with an IEC 61850 server.

This association can be started:

- from an “administrator” HMI (state “connected admin”),
- from an “observer” HMI (state “connected obs”),
- from PACiS SMT KERNEL if disturbance monitoring is configured (state "connected kernel”),

(States and transitions are marked on the diagram.)

T1 : connect (Admin)
T2 : disconnect AND no more connection (Admin and Obs) AND dist. monitoring on
T3 : connect (Obs)
T4 : disconnect AND connected Admin
T5 : disconnect AND no more connection (Admin and Obs)
T6 : disconnect AND no more connection (Admin and Obs)

</tbody>
</table>
2.6 **Configuration of MiCOM IEDs**

Following state diagram shows the integration of 4 engineering tools (the SCE, the SMT, the MiCOM S1 Studio and the IED Configurator) to facilitate the configuration and the setting of MiCOM IEDs.

![MiCOM S1 Studio Logic Diagram](image)

**FIGURE 1: MiCOM S1 STUDIO LOGIC DIAGRAM**

The SMT can launch from contextual menu in the equipment view MiCOM S1 Studio with the targeted IED for parameter, in order to have a direct connection between the MiCOM S1 and the IED. This facility is available for IEC61850 IEDs and legacy IEDs.
COMMISSIONING
## CONTENT

1. **SCOPE OF THE DOCUMENT**  
   
2. **COMMISSIONING PROCEDURES**  
   2.1 PACiS SMT KERNEL & HMI  
   2.2 PACiS SMT WTS  
      2.2.1 Server side configuration  
      2.2.2 Client side configuration
1. SCOPE OF THE DOCUMENT

This document is a chapter of the PACiS SMT manual. It describes the commissioning of the product that should not be confused with application commissioning. This chapter follows directly the IN installation chapter.

To commission PACiS SMT, it is only necessary to verify that the software is functioning correctly in the defined environment.
2. COMMISSIONING PROCEDURES

2.1 PACIS SMT KERNEL & HMI

**NOTE:** All figures are extracted from PACiS SMT and provided as example

Once the installation is processed, the "exe" directory is as follows:

![File Explorer window showing the content of the "exe" directory](image)

**FIGURE 1: THE CONTENT OF EXE DIRECTORY**

- Directories are always present, except `dtd` which is only present on Kernel,
- Files `hmi.*` and `SMT_hmi.exe` are present only if HMI is installed,
- Others files are present only if Kernel is installed.
2.2 PACiS SMT WTS

2.2.1 Server side configuration

To move System Databag files (.zip files) from the client side to the server side, use the SMT and File Transfer Protocol (FTP) via Windows Terminal Services (WTS).

Internet Information Services (IIS) is a web server provided with the Microsoft® Windows 2003 Server. You can easily configure the IIS to make an FTP site. Once you set up the Microsoft® Windows 2003 Server, configure the IIS as follows:

1. Open the Internet Services Manager panel: Start -> Programs -> Administrative Tools -> Internet Services Manager.
2. Select your IIS server.
3. Select Default FTP Site Right click and select Properties. Please refer to Figure 2.

![FIGURE 2: INTERNET INFORMATION SERVICES (IIS) CONFIGURATION DISPLAY](image)
4. Configure the user profiles for those users who you will allow to get FTP access to your server. These user profiles are the same user profiles that are used to log on. In the PACiS context, use the same user profile as the one you use for WTS. Make sure to uncheck the box **Allow Anonymous Connections**
5. Configure the directory that you use to store the content of the FTP site. In the PACiS OI context, this directory is the one where you put databag files. Make sure that you select Read and Write.

6. For the command By default, all computers will be, select Granted Access.

7. Click Apply. Click OK. The FTP site of PC1 is serviceable. Use an Internet browser to get easy access to the FTP site. The server side installation is now complete.
2.2.2 Client side configuration

1. For a Client PC that operates with Windows 2003 or XP, go to Tools -> Internet Options. You must verify only one parameter:

2. Make sure that you select Enable folder view for FTP sites. The firewall updates automatically and will not block remote access.
COMMISSIONING RECORD SHEET

</table>
1. SCOPE OF THE DOCUMENT

This document is a chapter of the PACiS SMT manual. It describes the Maintenance procedure and Fault Finding of the PACiS SMT Application software. Reading of SA chapter is mandatory.
2. **STANDARD MAINTENANCE OPERATION**

The aim of this chapter is to describe standard way to diagnosed PACiS SMT status, and common maintenance operation.

When maintenance action is planned, the operator should prepare, act and report.

The minimal preparation is to get the commissioning Record Sheet (see the RS chapter) of installed PACiS SMT in order to see the product version and its history. The User should refer also to its own exploitation besides this manual. It is also recommended to pick-up extraction of logbook history to be informed of the intervention conditions.

When facing - the product several designations has been implemented to check the context, whose main ones, at a first level are the messages directly displayed by the PACiS SMT application on the screen of the PC.

### 2.1 PACiS SMT KERNEL Fault code and signal description

#### 2.1.1 PACiS SMT systray icon

As soon as PACiS SMT KERNEL Application is started, an icon (1) is available in the Microsoft® Windows Operating System.

![(1) SMT Kernel Icon](image)

**FIGURE 1: SMT KERNEL ICON**

If the IEC 61850 agency is available this icon is green, else it's yellow. If the last agency configuration request has failed (and agency is available) then this icon is red.

By right-clicking the PACiS SMT kernel icon a contextual menu with the following items is displayed:

![Trace Kernel](image)

**FIGURE 2: SMT CONTEXTUAL MENU**
By clicking options, except **Exit Kernel**, an authentication window is displayed with login and password.

![Authentication Window](image)

**NOTE:** The SMT login (profile) definition and passwords setting are described on SMT chapter HI, please refer it for details.

**Trace Kernel:** This action displays the Kernel trace window. This window is real-time updated and appears as follows:

![Kernel Trace Window](image)

**FIGURE 3: TRACE KERNEL WINDOW**

- The user can clear the window with the **Clear** button, freeze or resume the display with the **Resume / Freeze** button.
- When **Start record** is pressed, everything which is displayed in this window is copied in **TraceKernel** file in the trace directory (%SMT_DIR%\trace). Press **Stop Record** to stop recording. Be careful, each time a recording is started, the file TraceKernel is reset.
- A message is displayed if the freezing has been too long and then events have been lost.

**NOTE:** The **Kernel trace** window can be displayed too by clicking **Trace/Display** in the main window.

![Kernel Trace from SMT Main Window](image)

**FIGURE 4: OPENING THE KERNEL TRACE FROM THE SMT MAIN WINDOW**

**Set password:** Passwords setting for each login (profile) are described on SMT chapter HI, please refer it for details.

**Configure kernel:** This action displays the main window (described in the next section).
**View security logs:** This action displays first, an **authentication window login Security administrator and password.** If the password is correct, the SecurityLog Window is displayed.

**Exit:** This action displays a confirmation dialog box.

NOTE: You can also see SMT calls to agency services and callbacks using Dbgview from Sysinternals in the Tools folder.

Select in the menu Options: Clock Time and Show Milliseconds.

To set the name of the debug window:

⇒ Add manually to the registry the new key *dbWinName* as follow:

```
HKEY_LOCAL_MACHINE/Software/…/Smt/dbWinName
```

⇒ Set the value to SMT.
2.1.2 PACiS SMT KERNEL main window

The main window of PACiS SMT KERNEL is composed of:

- a menu bar (1),
- a status bar (2) showing:
  - the presence of observers (3), with their IP addresses or names,
  - the presence of an administrator on the system (4), with its IP address or name,
  - the connection status of PACiS SMT to IEC61850 station bus (5),
  - the system current database Vdbs (6),
  - the system standby database Vdbs (7).

![FIGURE 8: PACiS SMT KERNEL MAIN WINDOW](image)

2.1.2.1 PACiS SMT KERNEL System menu

![FIGURE 9: SYSTEM MENU](image)
The system menu has one item:

**Exit:** This action displays a confirmation dialog box.

![Exit Confirmation Dialog Box](image1)

2.1.2.2 PACiS SMT KERNEL Trace menu

The **Trace** menu is composed of the three following items:

![Trace Menu](image2)

- **Set level:** this action displays the following window which allows to select the trace level.

![Set Trace Level Dialog Box](image3)
Set trace filter: this action displays the following window which allows to select the messages to be displayed.

![Set trace filter dialog box](image)

**FIGURE 13: SET TRACE FILTER DIALOG BOX**

1. **UCA agency (except heart beat and Diag):** when this check box is selected all the messages transmitted between the SMT kernel and the SBUS agency, (except heart beat messages and Diag messages), are displayed in the trace window.

2. **Hmi request:** when this check box is selected all the requests transmitted from the SMT HMI to the SMT kernel are displayed in the trace window.

3. **System database:** when this check box is selected all information related to addition of a database is displayed in the trace window.

4. **Dialogs with application:** when this check box is selected all the messages transmitted between the SMT kernel and the SBUS devices are displayed in the trace window.

5. **Messages sent in multicast:** when this check box is selected all the messages sent transmitted from SMT kernel to all the SMT HMI are displayed in the trace window.

6. **Kernel internal messages:** when this check box is selected all the internal debug messages generated by the SMT kernel are displayed in the trace window.

7. **Agency heart beat:** when this check box is selected all the periodic heart beat messages received from the SBUS agency are displayed in the trace window.

8. **Diag (equipment and IEDs):** when this check box is selected all the diagnostic messages and related report messages are displayed.

**Display:** this action displays the kernel trace window (see Figure 3: trace kernel window). Trace level(s) and filter(s) choices are saved on the disk.
2.1.2.3 PACiS SMT KERNEL Show menu

It shows the following items:

**Equipment**: This action displays all the equipment currently connected by all the connected PACiS SMT HMI's, their status and by who the connection is requested, in the following table. The request column indicates if a request on this equipment is on-going (it contains then the request name). Any on-going request can be aborted from there, with a right click on the selected line. When a disturbance file upload is on-going it's indicated in the column request (and abort is not available).

**System DB**: This action displays all the system Databases currently available in the Kernel.
Kernel param: This action displays all the kernel parameters current values.

FIGURE 17: KERNEL PARAMETERS WINDOW

Stop: This action clears the main window center panel.

2.1.2.4 PACIS SMT KERNEL Help menu

The Help menu has an item: About System Management Tool… which gives the SMT release number.

FIGURE 18: HELP MENU

2.2 PACIS SMT HMI Fault code and signal description

The log display window and log file are described in section 2.5 of chapter Human Interface of this documentation (document PACIS SMT/EN HI/C50).
3. ADVANCED MAINTENANCE OPERATION

System revision used by PACiS SMT KERNEL to check IEC 61850 applications compatibility is stored in the Microsoft® Windows registry, at the following location:

```
HKEY_LOCAL_MACHINE\SOFTWARE\AREVA\PACIS\SMT\SystRev
```

NOTE: For registry keys details, please consult the Schneider Electric technical support if needed.

The displayed keys are:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Data</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>smt_hmi</td>
<td>REG_SZ</td>
<td>C:\Program Files\Pacis\Smt</td>
<td>Folder of the hmi executable</td>
</tr>
<tr>
<td>smt_kernel</td>
<td>REG_SZ</td>
<td>C:\Program Files\Pacis\Smt</td>
<td>Folder of the kernel executable</td>
</tr>
<tr>
<td>Status</td>
<td>REG_SZ</td>

<td></td>
</tr>
<tr>
<td>SystRev</td>
<td>REG_SZ</td>
<td>1</td>
<td>0: UCA2 SBUS 1: IEC-61850 SBUS</td>
</tr>
</tbody>
</table>

The folder name `HKEY_LOCAL_MACHINE\SOFTWARE\AREVA\PACIS\Smt\<x.yy.zz>` gives the release of the installed SMT.

In the example above, the release is K.04.07.
PROBLEM ANALYSIS

Specific dipole switch with the capability to make line current and break fault current. Some have isolation capability, i.e. nominal grounding (earthing) at each side. |
| CBC | Compact Bay Controller  
Small capacity Bay Computer for Medium Voltage applications, typically C264C |
| CC | Complemented Contact |
| CCU | Circuit breaker Control Unit  
C264 Bay Computer board dedicated to switch control with 8DI, 4 DO |
| CDM | Conceptual Data Modeling  
This is the modeling of system/devices data using a hierarchy of structured data (called object or class) with their attributes, methods or properties and the relations between each other. It maps common data to devices or components of devices, with guarantee of interoperability. |
| Class | Defined in IEC 61850 as: description of a set of objects that share the same attributes, services, relationships, and semantics |
| Client | Defined in IEC 61850 as: entity that requests a service from a server and that receives unsolicited messages from a server |
| CM | Commissioning |
| CMT | Computer Maintenance Tool |
| CO | Command, logic information Output (Functional Component) / Contact Open |
| COMTRADE | Common Format For Transient Data Exchange (international standard IEC 60255-24) |
| CPU | Central Processing Unit  
C264 Bay Computer main board based on a Power PC |
| CRC | Cyclic Redundancy Check  
Coding result sent with packet of transmitted data to guarantee their integrity. Usually result of a division of transmitted data by polynomial. |
| CSV | Character Separate Values  
ASCII values separated by a predefined character or string as in Excel or ASCII Comtrade |
| CT | Current Transformer  
Basically the electric device connected to process and extract a current measurement. By extension, part of a device (C264) that receives an AC value and converts it into a numerical measurement value. |
| CT/VT (Conventional) | Current and Voltage transformers  
By extension, the C264 TMU board. |
| **CT/VT (Non-Conventional or intelligent)** | Current and Voltage transformers  
New generation of transducer based for example on light diffraction under an electric field. Without transformer, gives a direct numerical measurement of voltage and current as a communicating IED. |
| **CSV** | Character Separated Values  
ASCII values separated by predefined character or string as in Excel or ASCII Comtrade. |
| **DAC** | Data Acquisition component of the GPT  
Digital to Analog Converter  
Used to generate an analog signal (usually DC) from a digital value. |
| **DB** | DataBase  
Tool or set of data that defines the entire configuration of a system or specific device such as a computer. In contrast to a setting or parameter, the DB has a structure that cannot be modified on-line. DBs are always versioned. |
| **DB-9** | A 9-pin family of plugs and sockets widely used in communications and computer devices. |
| **DBI** | Don’t Believe It  
Term used for an undefined state of a double point when inputs are not complementary. DBI00 signifies dynamic state or jammed. DBI11 signifies undefined. |
| **DBID** | Databases Identity Brick |
| **DC** | Direct Current |
| **DC, DPC** | Double (Point) Control  
Two digits and/or relay outputs used for device control with complementary meaning (OPEN, CLOSE). |
| **DCF77** | External master clock and protocol transmission  
LF transmitter located at Mainflingen, Germany, about 25 km south-east of Frankfurt/Main, broadcasting legal time on a 77.5 kHz standard frequency. |
| **DCO** | Double Control Output |
| **DCP** | Device Control Point  
Located at device level (electric device or IED). It should have its own Remote/Local switch. |
| **DCS** | Digital Control System  
Generic name of system based on numeric communication and devices, to be opposed to traditional electrically wired control. |
| **DCT** | Double Counter  
Counter based on 2 DI with complementary states (counting switching operations, for example) |
| **DE** | Direct Execute |
| **DELTA** | Phase-to-phase delta values |
| **Device** | Term used for one of the following units: Protective relays, metering units, IED, switchgear, disturbance or quality recorders.  
Switchgear: switching device such as a CB, disconnector or grounding (earthing) switch |
| **DHMI** | C264 Display HMI |
| **DI** | Digital Input  
Binary information related to the presence or to the absence of an external signal, delivered by a voltage source. |

<tbody>
<tr>
<td>DIN</td>
<td>Deutsche Institut für Normung (The German standardization body.)</td>
</tr>
<tr>
<td>DIU</td>
<td>DC Input Unit (C264 Bay Computer board name for Digital Input)</td>
</tr>
<tr>
<td>DLL</td>
<td>Dynamic Link Library. Available on Windows XP. A feature that allows executable code modules to be loaded on demand and linked at run time. This enables the library-code fields to be updated automatically, transparent to applications, and then unloaded when they are no longer needed.</td>
</tr>
<tr>
<td>DM</td>
<td>Digital Measurement (A measurement value with acquisition by DI and a specific coding BCD, Gray, 1-out-of-n, and so on.)</td>
</tr>
<tr>
<td>DNP3.0</td>
<td>Distributed Network Protocol (DNP3 is a set of communication protocols used between components in process automation systems.)</td>
</tr>
<tr>
<td>DO</td>
<td>Digital Output (Used to apply a voltage to an external device via a relay, in order to execute single or dual, transient or permanent, commands.)</td>
</tr>
<tr>
<td>DOF</td>
<td>Degree Of Freedom (Used for a template attribute that can be modified or not when used. An attribute has a degree of freedom if a user can modify its values on its instances.)</td>
</tr>
<tr>
<td>DOU</td>
<td>Digital Output Unit (C264 Bay Computer board name for Digital Output)</td>
</tr>
<tr>
<td>DP</td>
<td>Double Point (Information/control derived from 2 digital inputs/output; usually employed for position indication of switching devices (OPEN, CLOSE).)</td>
</tr>
<tr>
<td>DPC</td>
<td>Double Point Control</td>
</tr>
<tr>
<td>DPS</td>
<td>Double Point Status (Position indication of switching devices (OPEN, CLOSE).)</td>

<tr>
<td>MDIO</td>
<td>Management Data Input/Output A standard driven, dedicated-bus approach that is specified in IEEE 802.3 Measurements</td>
</tr>
<tr>
<td>Metering (non-tariff)</td>
<td>Values computed depending on the values of digital or analog inputs during variable periods of time (time integration).</td>
</tr>
<tr>
<td>Metering (tariff)</td>
<td>Values computed depending on the values of digital or analog inputs during variable periods and dedicated to the energy tariff. These values are provided by dedicated “tariff computers” external to the MiCOM Systems.</td>
</tr>
<tr>
<td>MIDOS</td>
<td>Schneider Electric Connector: Used for CT/VT acquisition</td>
</tr>
<tr>
<td>MMC</td>
<td>Medium Modular Computer</td>
</tr>
<tr>
<td>MMS</td>
<td>Manufacturing Message Specification (ISO 9506)</td>
</tr>
<tr>
<td>Modbus</td>
<td>Communication protocol used on secondary networks with IED or with SCADA RCP. 2 versions. Standard MODICON or Schneider Electric.</td>
</tr>
<tr>
<td>Module</td>
<td>Word reserved in PACiS SCE for all electric HV devices. It groups all switch-gear devices, transformers, motors, generators, capacitors, ...</td>
</tr>
<tr>
<td>Abbreviation</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>-------------</td>
</tr>
<tr>
<td><strong>MOTION</strong></td>
<td>Transient state of a Double Point. Occurs when the two associated digital inputs are momentarily in state 0 (e.g., position indication when an electrical device is switching). The concept of “momentarily” depends on a user-selectable delay.</td>
</tr>
<tr>
<td><strong>MPC</strong></td>
<td>Protection Module for Computer</td>
</tr>
<tr>
<td><strong>MV</strong></td>
<td>Medium Voltage</td>
</tr>
<tr>
<td><strong>MVAR</strong></td>
<td>Mega Volt Ampere Reactive</td>
</tr>
<tr>
<td><strong>NBB</strong></td>
<td>Numerical Busbar Protection</td>
</tr>
<tr>
<td><strong>NC</strong></td>
<td>Normally Closed (for a relay)</td>
</tr>
<tr>
<td><strong>NO</strong></td>
<td>Normally Open (for a relay)</td>
</tr>
<tr>
<td><strong>OBS</strong></td>
<td>One-Box Solution. Computer that provides protection and control functions with local HMI. The prime application of this device is intended for use in substations up to distribution voltage levels, although it may also be used as backup protection in transmission substations. Likewise, the OBS may be applied to the MV part of a HV substation that is being controlled by the same substation control system.</td>
</tr>
<tr>
<td><strong>OI</strong></td>
<td>Operator Interface</td>
</tr>
<tr>
<td><strong>OLE</strong></td>
<td>Object Linking and Embedding. OLE is a Microsoft specification and defines standards for interfacing objects.</td>
</tr>
<tr>
<td><strong>OLTC</strong></td>
<td>On Line Tap Changing</td>
</tr>
<tr>
<td><strong>OMM</strong></td>
<td>Operating Mode Management</td>
</tr>
<tr>
<td><strong>OPC</strong></td>
<td>OLE for process control. OPC is a registered trademark of Microsoft, and is designed to be a method to allow business management access to plant floor data in a consistent manner.</td>
</tr>
<tr>
<td><strong>Operation hours</strong></td>
<td>Sum of time periods during which, a primary device is running in the energized state. For example, a circuit breaker is in Closed state and the current is not equal to 0 A.</td>
</tr>
<tr>
<td><strong>OSI</strong></td>
<td>Open System Interconnection. Split and define communication in 7 layers: physical, link, network, transport, session, presentation, application.</td>
</tr>
<tr>
<td><strong>OWS</strong></td>
<td>Operator WorkStation (PACiS OI)</td>
</tr>
<tr>
<td><strong>PACiS</strong></td>
<td>Protection, Automation and Control Integrated Solutions</td>
</tr>
<tr>
<td><strong>PLC</strong></td>
<td>Programmable Logic Control/Chart. Includes PSL and ISaGRAF. The configurable control sequences or automations taken into account by the MiCOM Systems are defined within the PLC program.</td>
</tr>
<tr>
<td><strong>POW</strong></td>
<td>Point On Wave. Point on wave switching is the control process of the three poles of an HV-circuit breaker in a manner that to minimize the effects of switching.</td>
</tr>
<tr>
<td><strong>PSL</strong></td>
<td>Programmable Scheme Logic</td>
</tr>
<tr>
<td><strong>PSTN</strong></td>
<td>Public Switched Telephone Network</td>
</tr>
<tr>
<td><strong>RCC</strong></td>
<td>Remote Control Centre. Computer or system that is not part of a MiCOM system. RCC communicates with and supervises a MiCOM system using a protocol.</td>
</tr>
</tbody>
</table>
| **RCP** | Remote Control Point  
Name given to the device or part used to control remotely several bays or sub-stations. Usually associated with Remote/Local sub-station control. It is a SCADA interface managed by the MiCOM system through the Telecontrol BUS. Several RCPs can be managed with different protocols. |
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Remote Control Mode</strong></td>
<td>When set for a control point, it means that the commands are issued from an upper level and are not allowed from this point.</td>
</tr>
<tr>
<td><strong>Remote HMI</strong></td>
<td>Remote HMI is a client of the substation HMI server. The client may provide all or part of functions handled by the substation HMI.</td>
</tr>
</tbody>
</table>
| **RI** | Read Inhibit  
This output indicates the availability of an analog output (e.g. during DAC converting time) |
| **RJ-45** | Registered Jack-45  
A 8-pin female connector for 10/100 Base-T Ethernet network |
| **RMS** | Root Mean Square |
| **RRC** | Rapid ReClosure |
| **RSE** | Régime Spécial d’Exploitation  
French grid function when work is being done on an HV feeder |
| **RSVC** | Re-locatable Static VAR Compensator |
| **RS-232** | Recommended Standard 232  
A standard for serial transmission between computers and peripheral devices. |
| **RS-422** | A standard for serial interfaces that extends distances and speeds beyond RS 232. Is intended for use in multipoint lines. |
| **RS-485** | A standard for serial multipoint communication lines.  
RS 485 allows more nodes per line than RS 422. |
| **RSVC** | Re-Locatable Static Var Compensator |
| **RTC** | Real Time Clock |
| **RTU** | Remote Terminal Unit  
Stand-alone computer that acquires data and transmits them to RCP or SCADA. Typically it is the C964. RTU link is the TBUS. |
| **SAT** | Site Acceptance Test  
Validation procedures executed with the customer on the site. |
| **SBMC** | Site Based Maintenance Control mode  
A bay in SBMC mode does not take into account the commands issued from RCP. Moreover, some of its digital points & measurements (defined during the configuration phase) are not sent to the RCP anymore (they are “automatically” suppressed). |
| **SBO** | Select Before Operate  
A control made in two steps, selection and execution. The selection phase gives a feedback. It can be used to prepare, reserve during time, configure a circuit before execution. Controls are done into a protocol, or physically (select with DI Select then DO execute). |
| **S-BUS** | Station Bus, network between PACIS devices. |
| **SCADA** | Supervisory Control And Data Acquisition  
Equivalent to RCC |
<p>| <strong>SCD</strong> | Description file extension |
| <strong>SCE</strong> | System Configuration Editor |
| <strong>SCL</strong> | Substation automation system Configuration Language (IEC 61850-6) |</p>
