CE
Thank You!
Thank you for choosing the APC Silcon Series UPS. Please read this Installation Guide thoroughly prior to installing the system. It provides important information on safe and efficient installation.

The installation and use of this product must comply with national, federal, state, municipal and local codes.

Safety Symbols used in this manual

**WARNING!** Indicates a hazard which, if not avoided, could result in injury or death.

**CAUTION!** Indicates a hazard which, if not avoided, could result in damage to the product or other property.

**NOTICE!** Read and pay attention to this important information.

---

**WARNING!**
This UPS unit contains hazardous AC and DC voltages. Only qualified electricians should install the UPS, AC line and external batteries, and must be familiar with batteries and battery installation.

Before installing, maintaining or servicing the UPS, shut off the UPS and disconnect all sources of AC and DC power.

As the UPS has no built-in disconnection devices to switch off external AC and DC input power, ensure that disconnection devices are provided as separate parts in connection with the installation!

The installer must provide each external disconnecting device for this UPS system with labels with the following text:

“Isolate the Uninterruptible Power Supply (UPS) as instructed in this guide before working on circuit”

AC and/or DC voltage will always involve a potential risk of AC voltage at UPS output generated from either batteries or mains. To avoid equipment damage or personal injury, always assume that there may be voltage at UPS output.

This system is equipped with an auto-start function. If activated, the system may start without warning. Refer to the “Programming” section of this guide for information on de-activation.

**TEST BEFORE YOU TOUCH!**
To reduce the risk of fire or electric shocks, install the UPS and external batteries in a temperature and humidity controlled indoor area, free of conductive contaminants.

UPS batteries are high-current sources. Shorting battery terminals or DC terminals, DC busbars can cause severe arcing, equipment damage and injury. A short circuit can cause a battery to explode. Always wear protective clothing and eye protection and use insulated tools when working on batteries.

---

**CAUTION!**
This unit contains components sensitive to electrostatic discharge (ESD). If you do not follow the normal ESD procedures, you may cause severe damage to electronic components.

1.0 Introduction

Power regulation varies from country to country, and information given in this installation guide can therefore only be of a general nature. Electricians should therefore always refer to national and local electrical codes prior to installing the UPS system.

1.1 Tools and Equipment

**CAUTION!**
Heavy equipment. To prevent personal injury or equipment damage, take extreme care when handling and transporting UPS cabinet and equipment.

**CAUTION!**
Ensure that front doors are in place and that internal front cover is fastened by screws before attempting to lift or transport the system.

This section lists all tools and equipment required to install all UPS configurations. See also section 4.0 of this guide for further details on connection.

**Tools:**
- 10mm socket
- 13mm socket-deep
- 17mm socket
- 19mm socket-deep
- 19mm combo wrench
- Small flat head/regular screwdriver
- #3 philips screwdriver
- Compression lug crimping tool
- Knock-out set (for glands)

**Equipment:**
- Compression lugs for cable terminations
- Cable to Service Bypass Panel from system feeder
- Cable to UPS input from Service Bypass Panel
- Cable to Service Bypass Panel from UPS output
- Cable from Service Bypass Panel to customer distribution
- Cable to UPS input from external batteries/external Battery Breaker Box (systems with external battery)
- Solid core, control cable to UPS from Service Bypass Panel
- Solid core, control cable to UPS from external batteries/external Battery Breaker Box
2.0 Unpacking

NOTICE!
Unless otherwise specified by the shipping company use a fork lift to unload equipment from pallet

1. To unpack UPS unit, remove top and bottom screws from side plates of packaging and lift up side plates
2. Verify compliance between type label on reverse side of front door and system ordered. Check input and output voltage
3. Copy type label data to label copy below for easy identification of system
4. Use fork lift to transport system to installation site
5. Open UPS doors and unscrew metal straps mounted on front cover of UPS
The shipping materials for the APC Silicon UPS are recyclable. Please save them for later use or dispose of them appropriately.
Installation

3.0 Installation

3.1 Requirements on Site

All system parts are accessible from front or top of UPS. Cable entries are accessible from bottom. A 1-metre free space on all sides should be allowed during installation. Once the system is installed it may be placed close to walls as long as free space is allowed for system doors to open. (As per applicable national and/or local codes.)

For ventilation and service purposes allow for free space of minimum 1m above the unit or per national and/or local codes and in front of UPS. Never install systems in direct sunlight.

**NOTICE!**
For reliability reasons do not stand on the UPS. Keep the UPS cabinet surface free of any objects.

### 3.1.1 Cabinet Dimensions H* x W x D - 1400 x W x 800 [mm]. Width as in below table:

* H is 1500 mm for optional IP31 cabinets

<table>
<thead>
<tr>
<th>UPS</th>
<th>Width Without Batteries [mm]</th>
<th>Width With Built-in Batteries [mm]</th>
<th>Width for Separate Battery Cabinets [mm]</th>

![Footprint Diagram](image2)
3.2.3 1000mm Cabinet for 10-20kW UPS with 3xBP I & Battery Cabinet for 1xBP III

3.2.4 600mm Cabinet for 40kW UPS without Batteries
3.2.5 1000mm Cabinet for 40kW UPS with 2xBP I
4.0 External Connection

4.1 Connecting the UPS

4.1.1 Connecting the 10-20kW UPS

**CAUTION!**
At a switch mode load of 100% the neutral must be rated for 200% output phase current

**CAUTION!**
This UPS unit is an EN 50091-2 product and may cause radio interference in a domestic environment. Take preventive measures if necessary.
External Connection

**NOTICE!**
Check correct phase rotation of mains input voltage!!
Max. input/output cables: 35mm².
If there is no neutral input Dzn0 or Dyn11 input isolation transformer is required.

### External Connection

<table>

PVC cables isolated to withstand ambient temperature of max. 30oC
** Must be rated as external PE cable if mains system is not supplying PE

**NOTICE!**
If an MCCB is used instead of external input fuses, the MCCB load capacity must be 8xIn (nominal current) for min. 10ms.
4.1.2 Connecting the 40kW UPS

**NOTICE!**
Install gland plate in bottom of unit

**CAUTION!**
At a switch mode load of 100% the neutral must be rated for 200% output phase current.

**CAUTION!**
This UPS unit is an EN 50091-2 product and may cause radio interference in a domestic environment. Take preventive measures if necessary.
External Connection

**NOTICE!**
Check correct phase rotation of mains input voltage!!
Max. input/output cables: 120mm². Battery: 70 mm².
If there is no neutral input Dzn0 or Dyn11 input isolation transformer is required.

<table>

PVC cables isolated to withstand ambient temperature of max. 30oC.
** Must be rated as external PE cable if mains system is not supplying PE.

**NOTICE!**
Install gland plate in bottom of unit.
4.2 System Integration Interface

System Integration Interface (SII) is the control link between UPS and system main switches as shown in above diagram. The purpose of the SII is to ensure correct operation of switches without losing system output power.

Auxiliary contacts on the main switches transmit the SII board inputs. Lamps on Service Bypass Panel and Battery Breaker Box/Battery Cabinet indicate “green light” for operation of output switches.

SII board also integrates input facilities for emergency shut-down and temperature compensation of charge voltage for external battery (use with battery monitor). “Battery operation” and “Common fault” are two main SII board status relay signals.
External Connection

4.2.1 Connections

System integration interface

Output relays: 277V/8A, 0.3VA-2kVA

Temperatura battery temperature sensor
(Charge voltage compensation: -0.576V/°C)

Emergency shut down with internal supply
Emergency shut down with external supply
Terminal Blocks: X003/X004 (Auxiliary Contacts)
When switching Q001, Q002, Q010, Battery Breaker 1 or Battery Breaker 2 from “ON or 1” to “OFF or 0”, the auxiliary contact has to be open BEFORE the corresponding main contacts are opened. When switching Q001, Q002, Q010, Battery Breaker 1 or Battery Breaker 2 the opposite way from “OFF or 0” to “ON or 1”, the auxiliary contact has to close with a maximum delay of 0.5 seconds from the time the corresponding main contacts are closed.

- This type of auxiliary contact is called a “late make” contact. (This also means that it will “break early” when activated in the opposite direction.)
- This auxillary contact is also called “NORMALLY OPEN” (NO), because the auxillary contact will be open when the main contacts are open.
- Please note that the above term “NORMALLY” has nothing to do with NORMAL UPS OPERATION MODE.

When switching Q003 from “OFF or 0” to “ON or 1”, the auxillary contact has to open BEFORE the corresponding main contacts are closed. When switching Q003 the opposite way from “ON or 1” to “OFF or 0”, the auxillary contact has to close with a maximum delay of 0.5 seconds from the time when the corresponding main contacts are opened.

- This type of auxillary contact is called an “early break” contact. (This also means that it will “make late” when activated in the opposite direction.)
- The auxiliary contact is also called “NORMALLY CLOSED” (NC), because the auxiliary contact will be closed when the main contacts are open.
- Please note that the above term “NORMALLY” has nothing to do with NORMAL UPS OPERATION.

X005 (Output Relays)
Battery operation signals are received with a 30-second delay. This function is inactive during battery test. Common fault relay facility is programmable (standard factory setting: 10 sec.) See APC Silcon User Guide for details.
Maximum nominal voltage on contact circuits is 277VAC. If two different phases are involved, maximum phase to neutral voltage should be below 160VAC. Please note that phase L1 is already present on the System Integration Interface board, supplied from the Service Bypass Panel. Therefore, if a phase is needed for alarm or signal purposes, Phase L1 should be used.

4.3 Parallel Board

CAUTION!
Control cables must be separated from AC and DC power cables.
The built-in parallel board connects two or more UPS systems in parallel, either to obtain increased system reliability or to obtain higher output power. The parallel board also ensures correct load-sharing between paralleled systems.

**NOTICE!**
For reliability reasons, APC recommends separate battery packs in redundant/parallel configurations.

To prepare the UPS for parallel/redundant mode, disconnect all sources of AC and DC power supply to the UPS and connect the ribbon cable from the parallel board to the main controller board (the ribbon cable is delivered with the UPS).

**CAUTION!**
DO NOT connect ribbon cable between controller and parallel card in single configurations. Ribbon cable is for parallel operation only.

Complete the parallel system set-up by connecting the external control cables (see below). Follow the instructions in the “Programming Parameters for Advanced Parallel” section of this guide to execute necessary re-programming.
**External Control Cables**

External multicore cable is equipped with 15-pin SUB-D plug at either end. Connect pin 1 to pin 1, and pin 2 to pin 2 etc. up to pin 15 - with the exception of pin 8, which is not to be connected.

Shield is connected to plug cover at both ends.

Terminals X020 and X021 for control cables located on parallel board. Connect X020 in UPS1 to X021 in UPS2, and connect X020 in UPS2 to X021 in UPS3 etc. Connect X020 in last UPS to X021 in UPS1.

UPS ships with cables (cable length: 6.5 m)

**Power Cables**

To optimize load-sharing in parallel operation, external power circuits must be "symmetrical": Power input and output cables to have same length and identical cross-sections.
4.4 Communication Interface Board

The 3-port ComInterface is used to establish an interaction between UPS and e.g. a computer system. Main purpose: To ensure a controlled computer shut-down in case of a mains supply failure.

4.4.1 Connections

Relay contacts rating: Max 42VAC or 60VDC  
min. 0.05A, max. 0.5A
4.5 Connecting of APC Silcon Tripel Chassis

The enclosed Triple Chassis must be connected to the serial port on the Communication Interface Board, and to the 24V supply (cables included). Terminal locations shown below.

23.62 inch/600mm Cabinet

X50 is a 24V supply for Triple Chassis.
Only to be used for this purpose.
Not suitable for telephone equipment.
Triple Chassis must be connected to both X50 and a serial port.

For more information please refer to the following section.
4.6 APC Silcon Triple Chassis

The APC Silcon Triple Chassis is an American Power Conversion (APC) external management peripheral that allows you to use monitoring and control management peripherals with your APC Silcon series UPS. The retrofit model is for use with Silcon series UPSs that are not equipped with a 24 VDC power port.

4.6.1 Safety Warnings

Use the APC Silcon Triple Chassis only in conjunction with an APC Silcon UPS.

Do not connect a computer to any APC Silcon Triple Chassis port using a straight-through extension cable. Use the communications cable provided with the APC Silcon Triple Chassis.

Connections using a cable made by any other manufacturer may cause damage or improper operation of the APC Silcon Triple Chassis, the UPS, or the computer.

4.6.2 Product Description

1 Monitoring port  3 Status LED
2 To UPS port     4 Optional Power port

4.6.2.1 Monitoring Port

The Monitoring port has two functions:

- Connecting to a terminal for configuration of the chassis. For direct connection to the Monitoring port, you must use the Monitoring cable supplied with the chassis (APC P/N 940-0024C).
- Connecting to other APC external management peripherals in a daisy chain.

4.6.2.2 To UPS Port

The “To UPS” port connects the chassis to the UPS, using the Silcon UPS cable (APC P/N 940-0071). The cable connector plugs into a communications port on an APC Silcon UPS.
4.6.2.3 LEDs

The APC Silcon Triple Chassis status LED provides important information concerning operation of the chassis. Refer to the table below for a description of the conditions indicated by the LED.

<table>
<thead>
<tr>
<th>IF the LED is...</th>
<th>THEN the Silcon Triple Chassis...</th>
</tr>
</thead>
<tbody>
<tr>
<td>off</td>
<td>is not receiving power.</td>
</tr>
<tr>
<td>flashing quickly</td>
<td>has not been configured. See the APC Silcon Management Quick Start Guide provided with your chassis or the Web/SNMP Management Card Installation Guide on the CD for more information.</td>
</tr>
<tr>
<td>(5 times per second)</td>
<td></td>
</tr>
<tr>
<td>flashing slowly</td>
<td>is powered on but is not communicating with the UPS.</td>
</tr>
<tr>
<td>(1 time per second)</td>
<td></td>
</tr>
<tr>
<td>on</td>
<td>is operating normally.</td>
</tr>
</tbody>
</table>

4.6.2.4 Optional Power Input

With the Optional Power input, you can power the APC Silcon Triple Chassis from an external source, using a 24 VDC power adapter. A universal adapter (AP9505i) or a standard adapter (AP9505) can be purchased separately from APC.

4.6.3 Installing Management Peripherals

There are two basic types of APC management peripherals that work with the APC Silcon Triple Chassis:

- Management peripheral cards, which fit into external management peripherals that are equipped with a card slot.
- External management peripherals, which connect to the Monitoring (or Advanced) port of other external management peripherals.

NOTICE!
The name “Monitoring” port varies from product to product, but its purpose is the same – to replicate the UPS communications port.
4.6.3.1 Order of Management Peripheral Cards

Because UPS signals are passed between management peripherals, you must install management peripheral cards in the correct order for them to work together properly. The card slots are numbered 1 to 3, from left to right, as viewed from the rear of the chassis. The following table lists the management peripheral cards, their priority, and proper position.

<table>
<thead>
<tr>
<th>Management Peripheral Card</th>
<th>P/N</th>
<th>Priority</th>
<th>Position</th>
</tr>
</thead>
<tbody>
<tr>
<td>Web/SNMP Management Card</td>
<td>AP9606</td>
<td>Highest</td>
<td>High-numbered slot</td>
</tr>
<tr>
<td>Out-of-Band Management Card (Call-UPS® II)</td>
<td>AP9608</td>
<td>Second-highest</td>
<td></td>
</tr>
<tr>
<td>Interface Expander</td>
<td>AP9607</td>
<td>Second lowest</td>
<td></td>
</tr>
<tr>
<td>Environmental Monitoring Card (Measure-UPS® II)</td>
<td>AP9612T</td>
<td>Lowest</td>
<td>Low-numbered slot</td>
</tr>
<tr>
<td></td>
<td>AP9612TH</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

NOTICE!
If your configuration requires additional power, connect a 24V AC/DC power adapter available from APC (part number AP9505 or AP9505i) for all models of Triple Chassis.

4.6.3.2 Installing Management Peripheral Cards

To install management peripherals, perform the following steps.

1) Make sure that the chassis is powered off.
2) Install management peripheral cards into the housings on the rear of the chassis. See the instructions supplied with the cards and the table above.
3) If you are daisy-chaining other APC external management peripherals to the APC Silicon Triple Chassis: Connect the UPS cable (supplied with the management peripheral) to the Monitoring port of the chassis and to the “To UPS” port of the other management peripheral (Share-UPS, MasterSwitch, etc.). See “Daisy-chaining the APC Silicon Triple Chassis”.
4) Power the APC Silicon Triple Chassis and all external management peripherals.

NOTICE!
When daisy-chaining Triple Chassis units, you may need to use a power adapter.

4.6.3.3 Daisy-chaining the APC Silicon Triple Chassis

If you need more than the three card slots available with the APC Silicon Triple Chassis, or if you want to use other external management peripherals, you can daisy-chain external management peripherals together, provided that the total amperage of all installed management peripherals — cards and external — does not exceed the supplied amperage. (See “Determining Power Requirements:”).
To add card slots, you can daisy-chain the APC Silicon Triple Chassis with the standard Triple Chassis (AP9604) management peripheral, installing the APC Silicon Triple Chassis closer to the UPS.

4.6.4 Powering the APC Silicon Triple Chassis

The APC Silicon Triple Chassis supplies power to the installed management peripheral cards and to the Monitoring port, allowing you to power multiple management peripherals.

4.6.4.1 AP9604S Power Considerations

The AP9604S model of the APC Silicon Triple Chassis receives its power from the UPS through the power connector of the Silicon UPS cable. If the total current required by all the installed management peripherals exceeds 500 mA, you must use a 24 VDC power adapter. To find out whether you need additional power, see “Determining power requirements”.

4.6.4.2 Power Adapters

APC offers two models of 24 VDC power adapter.

- The standard adapter (AP9505) can provide an additional 400 mA.
- The universal adapter (AP9505i) can provide 850 mA.

4.6.4.3 Using a Power Adapter

To use the adapter, plug it into a protected power outlet and into the Optional Power port of the APC Silicon Triple Chassis.

NOTICE!

If the power adapter loses power because of a UPS shutdown, its attached management peripherals may not operate properly, thus adversely affecting the UPS and its protected equipment.

4.6.4.4 AP9604SR Power Considerations

The AP9604SR model receives its power from the UPS through the supplied 24 VDC universal adapter. The total current required by your management peripherals must not exceed the 850 mA limit of the power adapter. See “Determining power requirements”.

4.6.4.5 Determining Power Requirements:

To determine the total amount of current required by your management peripherals, add the individual current requirements for each management peripheral to be installed with the APC Silicon Triple Chassis to the current requirements of the chassis itself. Refer to this table:

<table>
<thead>
<tr>
<th>Part #</th>
<th>Management Peripheral</th>
<th>Draw (mA)</th>
</tr>
</thead>
<tbody>
<tr>
<td>AP9207</td>
<td>Share-UPS 8-port Interface Expander</td>

</tbody>
</table>
External Connection

| AP9604S[R] | APC Silicon Triple Chassis | 90 |
| AP9606 | Web/SNMP Management Card | 110 |
| AP9607 | Interface Expander | 45 |
| AP9608 | Out-of-Band Management Card (Call-UPS II) | 35 |
| AP9612 | Environmental Monitoring Card (Measure-UPS II) | 60 |
| AP9825i | Isolated Extension Cable | 50 |
| AP9830 | Remote Power-Off Device | 35 |

4.6.5 Troubleshooting

The following table shows the solution to common problems with the operation of the Triple Chassis

<table>
<thead>
<tr>
<th>Problem</th>
<th>Possible Cause</th>
<th>Solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status LED is off</td>
<td>The chassis is not receiving adequate power.</td>
<td>See “Powering the APC Silicon Triple Chassis”, and verify that you are not exceeding current requirements.</td>
</tr>
<tr>
<td>Status LED is flashing quickly</td>
<td>The chassis has not been configured.</td>
<td>Configure the Silicon Triple Chassis. See the APC Silicon Management Quick Start Guide provided with your chassis or the Web/SNMP Management Card Installation Guide on the CD for more information.</td>
</tr>
<tr>
<td>Status LED is flashing slowly</td>
<td>The chassis is not communicating with the UPS.</td>
<td>Verify that the supplied UPS cable is properly connected to the Triple Chassis and to a communications port on the UPS.</td>
</tr>
<tr>
<td>Attached management peripheral cannot identify UPS model or nominal output voltage.</td>
<td>The management peripheral firmware does not support 3-phase UPSs.</td>
<td>You may be able to upgrade the firmware of the management peripheral. Call APC Customer Support.</td>
</tr>
</tbody>
</table>

4.6.5.1 If Problems Persist

For problems not covered in the troubleshooting chart or for persistent problems, follow this procedure:

1) Note the serial number and date of purchase of the APC Silicon Triple Chassis. Contact APC Customer Support at the phone number or address that is listed in this manual.

2) Be prepared to provide a description of the problem. A technician will help solve the problem over the phone, if possible, or will give you a return material authorization (RMA) number.

3) If the APC Silicon Triple Chassis is under warranty, repairs are free of charge. If the warranty has expired, there will be a nominal charge for repair.
4) Pack the APC Silcon Triple Chassis carefully in its original packaging, if possible. Do not use polystyrene beads for packing. Damage sustained in transit is not covered under the warranty. Enclose a letter in the package with your name, address, RMA number, a copy of the sales receipt, daytime phone number, and payment (if applicable).

5) Mark the RMA number clearly on the outside of the shipping carton. The factory will not accept any materials without this marking.

6) Return the Triple Chassis by insured, prepaid carrier to the address given to you by APC Customer Support.

4.6.6 Product Specifications

4.6.6.1 Monitoring Port Pin Assignments

The Monitoring port is a 9-pin communications port. The port operates with no flow control at a rate of 2400 baud. The data format is 8 data bits with 1 start bit, 1 stop bit, and no parity. When the Triple Chassis operates with simple signalling, the following limitations and capabilities apply to the Monitoring port:

- Pins 3, 5, and 6 are open collector outputs which must be pulled up to a common referenced supply no greater than +40 VDC. The transistors are capable of a non-inductive load of 25 mA. Use only Pin 4 as the common.
- The output at Pin 2 generates a low-to-high RS-232 level when the device is signalling an On Battery condition. The pin is normally at a low RS-232 level.
- The UPS is signalled to shut down when a high RS-232 level is applied to Pin 1 for 4.5 seconds. Shutdown is also dependent on the UPS status.

When the Triple Chassis operates with advanced signalling, the following limitations and capabilities apply to the Monitoring port:

- Pin 7 is unassigned.
- DC operating voltage is available on Pin 8. This voltage may be from the UPS or from an external adapter, whichever is greater.

4.7 APC Silicon Battery Cabinets

**IMPORTANT SAFETY INSTRUCTIONS**

a. The installation of battery drawers in UPS cabinets requires battery knowledge and should be made or supervised by qualified personnel only. Keep unauthorized personnel away from batteries.

b. Use identical battery types and numbers when replacing batteries. See battery supplier manual for further details.

c. **CAUTION** - Do not dispose of batteries in a fire. Battery may explode.

d. **CAUTION** - Batteries are fully charged on delivery. Do not short battery terminals or DC terminals.

e. **CAUTION** - Avoid rough treatment and opening of batteries. Released electrolyte is harmful to skin and eyes and may be toxic.

f. **CAUTION** - Batteries may cause electric shocks and high voltage short-circuit current. Follow below precautions when working with batteries:
   1. Remove watches, rings and other metal objects.
   2. Use tools with insulated handles.
   3. Wear rubber gloves and boots.
   4. Do not leave tools or metal parts on top of batteries.
   5. Disconnect charging source prior to connecting batteries.

Installation and use of this product must comply with all national, federal, state, municipal or local codes. If you need assistance, please have your UPS model and serial number ready and call APC, see “How to Contact APC” in this guide.

**WARNING!**

The entire system contains HAZARDOUS AC/DC VOLTAGES from several power sources. Some terminals and components are live even with the system being switched off!

**ONLY** qualified electricians should carry out installations according to national and local codes.

**NO** UPS types may have built-in batteries when connected to external batteries!

**NEVER** install batteries not complying with APC specifications. Failing that, the installer takes over full responsibility!

**NEVER** lift or transport connected or installed batteries.

**NOTICE!**

For reliability reasons do not stand on the UPS. Keep the UPS cabinet surface free of any objects.
4.7.1  Cabinets

UPS with Built-in Batteries

4.7.2  Preparing Batteries

CAUTION!

Battery drawer weighs approx. 22 kg with batteries.

The 12V, 7.2 Ah batteries are glued to drawer plate.

Battery drawers present a risk of electric shocks. Prior to installation of battery drawers, remove conductive jewellery such as chains, watches and rings. High-voltage short-circuits through conductive materials may cause severe burns.

Do not install battery drawers in UPS frame until all AC/DC sources are disconnected.

If battery drawers need to be stored for extended periods, store in a dry, cool environment.

Keep battery drawers in an upright position.

Do not stack more than 3 cardboard-wrapped battery drawers on top of each other.
External Connection

Battery drawers are wrapped in cardboard and delivered on pallets.

Unpack battery drawers, checking that type, number and size comply with the order.

Connect wire as shown below:
4.7.3 Mounting Batteries

**WARNING!**
Open front door of UPS and unscrew front cover. Do not install battery drawers in UPS frame until all AC/DC sources are disconnected. Disconnect charging source prior to connecting batteries. Ensure that battery breakers F001 and F002 are set to position “off”.

**WARNING!**
Before proceeding, ensure that power supplies have been disconnected from UPS for a minimum of 5 minutes.

Unscrew front frame of UPS and slide frame down as shown above. Battery drawers may be installed after removal of front cover.
External Connection

Check all battery connections to ensure that proper contact is established.

Insert battery drawers in the APC Silicon UPS

Connect all battery drawers to the terminal on the left side of the column
4.7.4 Final Checks

CAUTION!
Follow the “start-up procedure” in APC Silcon User Guide.

IMPORTANT SAFETY INSTRUCTIONS

a) The servicing of batteries requires battery knowledge and should be carried out or supervised by qualified personnel only. Keep unauthorized personnel away from batteries.

b) Use only R/C (BAZR2) batteries in UPS systems with built-in batteries.
   Max. battery length: 152mm
   Max. battery width: 67mm
   When mounting batteries allow for at least 0.2inch/0.5mm between batteries and also between batteries and battery shelf.

c) CAUTION - Batteries are fully charged on delivery. Do not short battery terminals or DC terminals.

d) CAUTION - Do not dispose of batteries in a fire. Batteries may explode.

e) CAUTION - Avoid rough treatment and opening of batteries. Released electrolyte is harmful to skin and eyes and may be toxic.

f) CAUTION - Batteries may cause electric shocks and high voltage short-circuit current.
   Follow the precautions below when working with batteries:
   1. Remove watches, rings and other metal objects.
   2. Use tools with insulated handles.
   3. Wear rubber gloves and boots.
   4. Do not leave tools or metal parts on top of batteries.
   5. Disconnect charging source prior to connecting or disconnecting batteries.
   6. Determine if the battery is inadvertently grounded. If inadvertently grounded, remove unwanted source of ground. Any contact with grounded battery may result in electric shocks. The likelihood of such shocks will be reduced if grounds are removed during installation and maintenance (applicable to a UPS and a remote battery supply without grounded supply circuit).
External Connection

4.7.5 APC Silicon Battery Cabinets

![Battery Cabinet UPS](image)

**IMPORTANT SAFETY INSTRUCTIONS**

a) The servicing of batteries requires battery knowledge and should only be carried out by qualified electricians familiar with batteries. Keep unauthorized personnel away from batteries.

b) Use identical battery types and numbers when replacing batteries. See battery supplier manual for further details.

c) **CAUTION** - Batteries are fully charged on delivery. Do not short battery terminals or DC terminals.

d) **CAUTION** - Do not dispose of batteries in a fire. Batteries may explode.

e) **CAUTION** - Avoid rough treatment and opening of batteries. Released electrolyte is harmful to skin and eyes, and may be toxic.

f) **CAUTION** - Batteries may cause electric shocks and high voltage short-circuit current. Follow the precautions below when working with batteries:

1. Remove watches, rings and other metal objects.
2. Use tools with insulated handles.
3. Wear rubber gloves and boots.
4. Do not leave tools or metal parts on top of batteries.
5. Disconnect charging source prior to connecting batteries.
6. Determine if the battery is inadvertently grounded. If inadvertently grounded, remove unwanted ground source. Any contact with grounded batteries may result in electric shocks. The likelihood of such shocks will be reduced if grounds are removed during installation and maintenance.

Installation and use of this product must comply with all national, federal, state, municipal or local codes. If you need assistance, please have your UPS model and serial number ready and call APC, see the section “How to contact APC” in this guide.

4.7.5.1 Installation of Batteries

See Installation Guide for Battery Cabinet for:

- Preparing Batteries and UPS
- Dimensions and Weight
- Connecting Batteries

**WARNING!**

The entire system contains HAZARDOUS AC/DC VOLTAGES from several power sources. Some terminals and components are live even with the system being switched off!

ONLY qualified electricians may install batteries and national and local codes must be followed.

NO APC Silicon UPS may have built-in batteries if connected to external batteries!

NEVER install batteries not complying with APC specifications. Failing that, the installer takes over full responsibility!

NEVER lift or transport connected/installed batteries.

**WARNING!**

Before proceding, ensure that power supplies have been disconnected from UPS for a minimum of 5 minutes.

**CAUTION!**

Follow “Start-up Procedure” in APC Silicon User Guide.

---

4.8 Battery Breaker Box/Fuse-box

**CAUTION!**
Batteries connected to a UPS out of service for a period exceeding 8 days may be damaged. Refer to Section 7.0 Power Disconnection in this guide.

Battery Breaker Box/Fuse-box provides overcurrent and short-circuit protection for UPS installations with external batteries.

**NOTICE!**
If battery has been disconnected, refer to Section: - UPS Start Up in the APC Silcon User Guide.

</tbody>
</table>

**NOTICE!**  
Change charge voltages, battery warning limit, shut down voltage and high battery temperature limit by entering the actual value. See example above.
5.2.2 Programming Example - Change to Output Isolation Transformer available

**NOTICE!**
Change parameters by pressing the \( \text{C} \) key once or several times. See example above.
5.3 Programming Parameters for Advanced Parallel Operation

To use the advanced parallel functions, the following parameters must be programmed:

1. “Station number”
2. “Highest station address”
3. “Advanced power management”
4. “APM test mode active”
5. “Battery connection”

5.3.1 Description of Settings

1. “Station number”
   - Valid station numbers: 1-9 stating the UPS parallel address in system.

2. “Highest station number”
   - Valid station numbers: 2-9 stating the number of UPSs in system.

3. “Advanced power management”
   - “Disabled”: Advanced Power Management is inactive.
   - “PARALLEL+1”: Advanced Power Management is activated when the system operates as PARALLEL N+1, meaning that one system can be isolated without overloading the remaining systems (N systems/UPSs).
   - “REDUNDANT+1”: Advanced power management is activated when the system operates as REDUNDANT N+1, meaning that one system can be isolated without overloading the remaining systems (N systems/UPSs) with one spare system.

4. “APM test mode active”
   - “No”: Stand-by-time will be 24 hours - on-line time will be 48 hours (xN systems).
   - “Yes”: Stand-by-time will be 1 min. - on-line time will be 2 min (xN systems).

5. “Battery connection”
   - “Separate”: Separate battery for this UPS.
   - “Common”: Common battery in a parallel system.

NOTICE!
“Common”: Common battery in a parallel system. When this setting is chosen, the highest battery temperature that can be found in the paralleled systems (for charge voltage compensation).

NOTICE!
Common battery pack is a technical possibility. However, APC recommend separate battery pack due to a higher safety degree in connection with redundant/parallel operation. The UPS system is designed for both situations.
5.3.2 Programming example

Example with four systems in parallel with separate batteries.

- Programme the station addresses 1-4: 1 for UPS 1, 2 for UPS 2, 3 for UPS 3, and 4 for UPS 4.
- All UPS systems have to be programmed to “Highest station address”:4.
- If APM is not to be tested, “APM test mode active” must be “NO”.
- If a system is isolated due to service, the station numbers must be reprogrammed for the remaining active systems starting with number 1 and ending with maximum number of active systems. No number must be left in this sequence. Furthermore, “Highest station address” must be changed to number of active UPSs in parallel.

5.4 Battery Monitor

5.4.1 Installation of new batteries

To avoid false alarms, the above procedure MUST be followed.

NOTICE!
Contact your local dealer if you have any questions regarding changing parameters.
6.0 Options/Accessories

Please contact your local APC representative for information on options/accessories available in your region. See “How to Contact APC” in this guide.

4 x ø 6.5mm: APC Service Bypass Panel 60kW & 80kW
*** If no external System Output fuses are available or if it has a higher value than indicated above, System Output and UPS Output cables should be dimensioned as System Input and UPS Input cables.

** Sizes according to IEC 364-5-532 for PVC insulated copper cables (max. ambient temperature: 30°C). Installation method B: Insulated conductors in wall conduit.

Also refer to local legal regulations.

Beware that single-phase Switch Mode Power supply loads will increase neutral current! At a 100% SMPS load, neutral cable should be dimensioned for 200% of phase current.

* Depth of enclosure includes switch handles

#### Lamp indication on Service Bypass Panel

- The Green lamp (H002) above the output switch handle (Q002) lights
- Now also the green lamp (H003) above the bypass switch handle (Q003) lights
- Only the Green lamp (H003) above the bypass switch handle (Q003) lights
- No lamps on the Service Bypass Panel light any longer
6.2 Service Bypass Panel for Parallel Redundant Operation
6.2.1 Two Parallel Systems with Service Bypass Panel
6.2.2 Parallel/Redundant Operation with Service Bypass Panel and External Battery via MCCB
Options/Accessories

6.2.3 Operating External Service Bypass Switch for Parallel Systems

6.2.3.1 Bypassing Parallel UPS Systems

CAUTION!
Batteries connected to a UPS out of service for a period exceeding 8 days may be damaged.
Options/Accessories

Action
Step 1-4 can be carried out with any of the parallel systems, however this will switch all systems into bypass operation.

1. Press [ ] on the keyboard
2. Press [ ] or [ ] on the keyboard until
3. Press [ ] on the keyboard
4. Press [ ] on the keyboard

All systems will transfer to bypass operation

Do not switch off any of the UPS systems until step 5-8 has been completed.

5. Check lamp indication on the Service Bypass Panel
6. Turn the external bypass switch (Q003) to position "1"
7. Turn the output isolator (Q004) to position "0"
8. Turn the output switches (Q002) to position "0"

9. Open the front door and press both the green "ON" and the red "OFF" keys simultaneously in any of the systems
   The acoustic alarm sounds for 30 sec. *
   Repeat for (all) other system(s).

10. Turn all input switches (Q001) to position "0"
    The red alarm LED below the display lights and the acoustic alarm sounds for 30 sec.

* The acoustic alarm can be reset by the [ ] key

Display shows

Lamp indication on bypass panel
The green lamp (H003) above the bypass switch handle (Q003) lights
The green lamp (H004) above the output isolator (Q004) and the green lamps (H002) above the output switch handles (Q002) lights
The green lamps (H002) above the output switch (Q002) light and the green lamp (H004) above the output switch (Q004) lights

</tbody>
</table>

Lamp indication on Service Bypass Panel

The green lamps (H002) above all the output switch handles (Q002) lights.
The green lamp (H004) above the output switch (Q004) handle also lights.
The green lamps (H002) above all the output switch handles (Q002) light. The green lamp (H004) above the output switch (Q004) handle and the green lamp (H003) above the bypass switch light.
The green lamps (H002) and (H004) do not light any longer. (H003) will light until normal operation.
6.2.4 Isolating One UPS for Service/Maintenance

In a redundant system, one UPS may be isolated for service/maintenance without affecting other UPSs.

1. Check that remaining UPS(s) is capable of carrying the load in the event that one UPS is isolated.
2. Switch off system to be isolated for maintenance purposes by pushing green “ON” and red “OFF” buttons simultaneously.
3. To disconnect battery, mains and output, open battery MCCB/fuse and set input switch (Q001) and output switch (Q002) to position “0”.

With Q002 in position “0”, UPS will be operational and may be tested as a single system without affecting other parallel UPS(s).
6.2.5 Switching Back to Normal Parallel/Redundant Operation

1. Turn input switch (Q001) and output switch (Q002) to position “1”
2. Charge capacitor, connect battery and start up UPS

UPS will automatically switch to normal operation and start load-sharing with other paralleled UPS(s).

WARNING!
System will discharge built-in capacitors, but check terminal voltage before proceeding.
6.3 Intersystem Synchronization Unit

Intersystem Synchronization Unit System (ISU System)
The ISU system consists of inter-connected ISUs. One ISU system may consist of up to 5 ISUs, regardless of ISU configuration. The ISU system synchronizes the voltage of parallel operation systems running in battery operation.

The ISU system may also include one or more external synchronization sources, e.g. a gen-set or a non-APCSilconUPS system.

Synchronization accuracy of the ISU is better than 2°.

Schematic overview of ISU system (example):

Intersystem Synchronization Unit (ISU)
The ISU is an active part of an ISU system, serving as the interface to the sources and the ISU system.

The ISU can be connected to a parallel UPS configuration, using the standard parallel communication controller in the parallel operation system.

(See Intersystem Synchronization Unit User’s Manual for further details.)
6.4 Relay Board

Relays
All relays are “fail safe”: In alarm modes, relay coil will be de-energized.

Maximum load: 8.0A – 250VAC
0.3A – 60VDC

Minimum load: 0.05A – 6VAC
0.05A – 6VDC
### 6.4.1 Relay Board/Relay Functions

**NOTICE!**
If alarm mode “Communication to controller lost” is active, ALL relays will indicate failure.

</tbody>
</table>
## Delay programmable in configuration stack: “Common fault delay”. Settings 0,10,20,30 seconds.
Maximum cable size: 2mm²

See section 5.2 in this guide for System configuration

**NOTICE!**
Alarm Trigging Events 1-2-3-9-10-11-13 activates the corresponding alarm relay after the delay.

Alarm Trigging Events 4-5-6-7-8-12-14-15 activates the corresponding alarm relay momentarily.

Common fault relay 16 is activated at the same time as relay 1-2-3-4-5-6-7-12-13-14-15, or in any of the below situations:
- Internal power supply fault
- System locked in operation mode
- Internal memory fault
- Internal communication fault
Options/Accessories

6.5 Weight Equalizer

Footprint - 600mm and 800mm
Footprint - 1000mm Cabinet
6.6 Remote Display

With the remote display unit data may be displayed at distances of up to 25 m from UPS. For extended communication distance, see section below.

Remote display may easily be connected to UPS via one of the two serial communication ports on the communication interface board.

To obtain a transmission distance of up to 3.2 km normal RS232C signal levels must be converted to a long distance communication standard. The converter must be placed outside the UPS cabinet.

6.6.1 Extension of Remote Display Communication Distance

Remote display communicates with the UPS through a 3-wire RS232 interface. Remote display is a DTE (Data Terminal Equipment) employing a SUB-D 9-pin female connector. Communication speed: 9600 bps.

For communication distances, see Table 1. Insert converters if longer distances are necessary, or if communication cables are led through magnetically noisy areas. Converters must comply with local regulations.

Table 1: Remote Display Communication Extensions

<table>
<thead>
<tr>
<th></th>
<th>Standard (RS232)</th>
<th>Short-haul Modem Async</th>
</tr>
</thead>
<tbody>

<td>RS232 BLACK BOX connector</td>
<td></td>
<td>Sub-D 25-pin female</td>
</tr>
<tr>
<td>BLACK BOX interconnector</td>
<td></td>
<td>4-screw terminal</td>
</tr>
</tbody>
</table>

Two converter boxes are required for a communication distance extension: One box near the UPS for the conversion from RS232C to a long distance communication standard, and another box at the other end to convert back to RS232C, which is to be connected to the Remote Display. The converter provides optical signal insulation. Both converter boxes must be supplied by an uninterruptible power source.
6.6.1.1 Connections Without Converter

Connect a 25-pin female Sub-D and a 9-pin male Sub-D connector with a 3-wire shielded cable, as shown in the table below. Connect shield at one end only.

<table>
<thead>
<tr>
<th>Pin Connection for Interconnection Cable (without converter):</th>

<td>No connection</td>
<td>House (Shield)</td>
</tr>
</tbody>
</table>

The ME800A-R2 must be set up as a DCE with no RTS/DTR control.

The interconnection cable between the two ME800A-R2 boxes is a 4-wire twisted pair telephone cable with or without shield. The shield improves noise immunity but reduces maximum communication distance.
6.6.2 Remote Display Installation

6.6.2.1 Connecting RS232C and Mains Adapter

**CAUTION!**
Wiring for alarm and signal circuit field to be rated 300V (minimum).

---

6.6.2.2 Remote Display Power Supply

The remote display is supplied by normal AC power with no battery back-up. For UPS data transmission to remote display to remain unaffected during power failure, the remote display must be supplied from an uninterruptible power source.

Converters used to extend communication distance must also be supplied from uninterruptible power sources.

6.6.2.3 Remote Display Cables

RS232C to RS232C cable:

Connect shield at one end only!
Rating: Refer to Local/National electrical codes.
Communication voltage ±15Vdc

---

990-4050a
6.6.3 Remote Display Use

The remote display is an inactive unit unable to influence the operation of the UPS. Some of the alarms visible on the internal display are also available on the remote display (See the Alarm section in the APC Silcon User Guide).

6.6.3.1 Initiating the Remote Display

After having connected the supply the display will show:

Remote Display: “APC Silcon UPS”

6.6.3.2 Communication Fault

Communication fault between UPS and remote display will appear in the display as follows:

“Data transmission interrupted”

6.6.3.3 Remote Display Setting

Use # Stack to select language and type of UPS connected to remote display.

<table>
<thead>

*DIN gL types

PVC cables isolated to withstand a maximum ambient temperature of 30°C.
Options/Accessories

NOTICE!
Check correct phase rotation of mains input voltage! Maximum input/output cables: 35mm². If input neutral is not available, an optional Dzn0 or Dyn11 input isolation transformer must be used.

NOTICE!
All external cable dimensions are recommended sizes only. Refer to local legal regulations.

NOTICE!
Make sure that gland plate is installed in bottom of cabinet.

CAUTION!
At 100% switch mode load, neutral must be rated for 200% phase current.
6.7.2 Wiring up UPS with External Yyn0 Isolation Transformer at Output

WARNING!
Isolation transformer provides galvanic isolation between mains supply and load. Load will lose galvanic isolation if isolation transformer is bypassed.

NOTICE!
Refer to local legal regulation for wiring information.
6.7.3 Wiring up UPS with External Yyn0 Isolation Transformer at Input

**WARNING!**
Isolation transformer provides galvanic isolation between mains supply and load. Load will lose galvanic isolation if isolation transformer is bypassed.

**NOTICE!**
Refer to local legal regulation for wiring information.
6.7.4 Wiring up UPS with External Optional Dzn0 Isolation Transformer at Input

**WARNING!**
Isolation transformer provides galvanic isolation between mains supply and load. Load will lose galvanic isolation if isolation transformer is bypassed.

**NOTICE!**
Refer to local legal regulation for wiring information.
6.7.5 Wiring up UPS with External Optional Dzn0 Isolation Transformer at Output

WARNING!
Isolation transformer provides galvanic isolation between mains supply and load. Do not bypass isolation transformer in order to avoid damaging circulation currents and to prevent load from loosing galvanic isolation.

NOTICE!
Refer to local legal regulation for wiring information.
6.7.6 Wiring up UPS with External Optional Dyn11 Isolation Transformer at Input

**WARNING!**
Isolation transformer provides galvanic isolation between mains supply and load. Do not bypass isolation transformer in order to avoid damaging circulation currents and to prevent load from losing galvanic isolation.

**NOTICE!**
Refer to local legal regulation for wiring information.

8.0 Warranty

8.1 APC Silicon Series Limited Factory Warranty

APC warrants that the unit, when properly installed and commissioned by APC or APC authorized service personnel, shall be free from defects in materials and workmanship for a period of (1) year from the date of installation or maximum 18 months after manufacturing. In the event that the unit fails to meet the foregoing warranty, APC shall for a period of one (1) year repair or replace any defective parts, without charge for on-site labor and travel if trained & authorized APC personnel has conducted start-up of the unit.

An APC Start-Up Service must be performed/completed by APC or APC authorized service personnel or the on-site factory warranty will be voided and replacement of defective parts only will be covered. APC shall have no liability and no obligation to repair the installed unit if non-authorized APC personnel performed the start-up and such start-up caused the unit to be defective.

APC SHALL NOT BE LIABLE UNDER THE WARRANTY IF ITS TESTING AND EXAMINATION DISCLOSE THAT THE ALLEGED DEFECT IN THE PRODUCT DOES NOT EXIST OR WAS CAUSED BY PURCHASER’S OR ANY THIRD PERSON’S MISUSE, NEGLIGENCE, IMPROPER INSTALLATION OR TESTING, UNAUTHORIZED ATTEMPTS TO REPAIR OR MODIFY, OR ANY OTHER CAUSE BEYOND THE RANGE OF THE INTENDED USE, OR BY ACCIDENT, FIRE, LIGHTNING OR OTHER HAZARD.

THERE ARE NO WARRANTIES, EXPRESSED OR IMPLIED, BY OPERATION OF LAW OR OTHERWISE, OF PRODUCTS SOLD, SERVICED OR FURNISHED UNDER THIS AGREEMENT OR IN CONNECTION HEREWITH. APC DISCLAIMS ALL IMPLIED WARRANTIES OF MERCHANTABILITY, SATISFACTION AND FITNESS FOR A PARTICULAR PURPOSE. APC’S EXPRESS WARRANTIES WILL NOT BE ENLARGED, DIMINISHED, OR AFFECTED BY AND NO OBLIGATION OR LIABILITY WILL ARISE OUT OF, APC’S RENDERING OF TECHNICAL OR OTHER ADVICE OR SERVICE IN CONNECTION WITH THE PRODUCTS. THE FOREGOING WARRANTIES AND REMEDIES ARE EXCLUSIVE AND IN LIEU OF ALL OTHER WARRANTIES AND REMEDIES. THE WARRANTIES SET FORTH ABOVE, CONSTITUTE APC’S SOLE LIABILITY AND PURCHASER’S EXCLUSIVE REMEDY FOR ANY BREACH OF SUCH WARRANTIES. APC’S WARRANTIES RUN ONLY TO PURCHASER AND ARE NOT EXTENDED TO ANY THIRD PARTIES.

IN NO EVENT SHALL APC, ITS OFFICERS, DIRECTORS, AFFILIATES OR EMPLOYEES BE LIABLE FOR ANY FORM OF INDIRECT, SPECIAL, CONSEQUENTIAL OR PUNITIVE DAMAGES, ARISING OUT OF THE USE, SERVICE OR INSTALLATION, OF THE PRODUCTS, WHETHER SUCH DAMAGES ARISE IN CONTRACT OR TORT, IRRESPECTIVE OF FAULT, NEGLIGENCE OR STRICT LIABILITY OR WHETHER APC HAS BEEN ADVISED IN ADVANCE OF THE POSSIBILITY OF SUCH DAMAGES.

* Not supplied by APC

** Internal Batteries available for 40kW units and smaller
Notes:

1. Nominal input current based on rated load.

2. Maximum input current based on rated load + full battery recharge. Full battery recharge assumed to increase input current with 10%.

3. Nominal power consumption (column 1c) based on nominal input current (1e) and the corresponding input voltage (1a).

4. Maximum power consumption (1d) based on maximum input current (1f) and the corresponding input voltage (1a).

5. Suggested input overcurrent protection (1h) based on continuous full load maximum input current (1f). MCCB breaker selection based on continuous full load nominal input current (1e) is acceptable, provided battery recharge time is short.

6. Fuses according to DIN LV HRC type gL, 500V assumed. MCCB load capacity must be 8xIn (nominal current) for minimum 10ms.

7. Suggested load side overcurrent protection (3b) based on nominal output current (3a).

8. Nominal battery voltage assumed to be 2V/cell (Lead technology).

9. Recommended cable sizes, see "External Connection" section of this guide. CAUTION! Cable sizes must comply with national and/or local legal regulations.

10. Nominal battery discharge current (2c) based on full rated load and nominal battery voltage (2V/cell).

11. Maximum battery discharge current (2d) based on full rated load and battery voltage at end of discharge (1.7V/cell).

12. Full load discharge power from battery based on nominal battery discharge current (2c) x nominal battery voltage (2x192cells x 2V/cell), or maximum battery discharge current (2d) x battery voltage at end of discharge (2x192cells x 1.7 V/cell).

13. Heat dissipation based on nominal full load capacity and linear load.
10.0 How to Contact APC

APC Corporate
132 Fairgrounds Road
West Kingston, RI 02892
USA
Telephone: +1 401 789-5735
Fax: +1 401 789-3710
