INTRODUCTION

The PowerLogic™ Sub Meter Display (SMD63M) is a comprehensive electrical sub metering display (Figure 1). With the display, you can view electrical parameters with one networked LCD. In addition to viewing system data on the display itself, you can also view data on a remote PC via a network connection. Touch pad buttons provide a convenient way to view downstream devices on the power monitoring network. The display is RS-485 Modbus RTU compatible. It has additional RS-485 and RS-232 Modbus ports for networking to additional displays or to a master PC.

![Diagram of PowerLogic™ Sub Meter Display](image)

**Figure 1  The Sub Meter Display**

The display provides local indication of all power system parameters from the compatible meters connected downstream. It is equipped with the following features for reporting critical alarm data:

- Two relay outputs
- One digital input
- Local LED alarm indication

All system parameters and alarms can transmit to the network operations center by means of Modbus RTU protocol.

The display supports the following multiple sensors:

- ENERCEPT® Meters
- Branch Circuit Monitors (BCM42)
- Multi-Circuit Meters (MCM8364)
- Alta Labs Network Temperatures and Humidity Sensors (HXO-485, TXO-485, and HXO/T-485)
Parts of the Sub Meter Display

Figure 2 shows the parts of the display, while Table 1 describes these parts.

INSTALLATION

**DANGER**

HAZARD OF ELECTRIC SHOCK, EXPLOSION, OR ARC FLASH

- Apply appropriate personal protective equipment (PPE) and follow safe electrical work practices. See NFPA 70E.
- This equipment must be installed and serviced only by qualified personnel.
- Turn off all power supplying this equipment and the equipment it is to be mounted inside before working on or inside equipment.
- Always use a properly rated voltage sensing device to confirm that power is off.
- Replace all device doors and covers before turning on power to this equipment.

Failure to observe these instructions will result in death or serious injury.

Mounting the Display on a Power Management Module (PMM)

To mount the display on a Power Management Module (PMM), refer to Figure 3 and Figure 4 and follow these steps:

1. Ensure that the display is not connected to power and turn off all power supplying the PMM and the equipment it is to be mounted inside before working on or inside the equipment.
2. Use a properly rated voltage sensing device to confirm that power is off.
3. Insert the display faceplate (A) into the upper device opening of the PMM panel door. Be sure that the four metal stand-offs insert through the four holes in the PMM door chassis.

![Figure 3 Mounting the Display on a PMM](image-url)
4. Secure the faceplate by screwing four threaded stand-offs (B) into the faceplate studs from the inside of the door.

5. Attach the display (C) to the threaded studs using the four #6-32 screws (D) provided.

6. Connect the membrane switch ribbon cable (E) to the membrane switch pin connector (F).

![Figure 4 Display Components](image_url)
COMMUNICATIONS

The display resides on a Modbus network as a pass-through device (Figure 5). It provides an upstream and downstream communication connection. This allows for flexible data retrieval as the upstream options include RS-232 or RS-485. Figure 6 shows the downstream and upstream wiring scheme.

Figure 5  Upstream Monitoring Network Option
Downstream Devices

Observe these guidelines for downstream devices communications wiring:

- Connect devices on a daisy chain from the downstream RS-485 port.
- The display can support 32 devices with a maximum distance of 4000 ft. (1,219 m) to the last device.
- For devices on the daisy chain, follow the device distance limitations recommended by the manufacturer.
- Each device must have a unique address.
- The last device must be terminated with a terminator (Square D part no. 3090MCTAS485 or 100 ohm resistor).

Upstream Devices

Observe these guidelines for upstream devices communications wiring:

- A master computer or additional Sub Meter Displays can be connected on a daisy chain to the upstream RS-485 port.
- The maximum distance from the first upstream device to the last is 4000 ft. (1,219 m).
- Each device on this upstream connection as well as those downstream must have a unique address.
- The last upstream device must be terminated with a terminator (Square D PN 3090MCTAS485 or 100 ohm resistor).
Terminating the Last Device in the Downstream Daisy Chain

Terminate the downstream network using the 3090MCTAS485 terminator to ensure reliable communications. Refer to Figure 7 and follow these steps:

1. Insert the wires of the daisy chain as shown in Figure 6 and insert the wires of the terminator into the holes of the RS-485 communications connector.
2. Using a small flat blade screwdriver, tighten the connector screws.
3. Plug the communications connector into the communications port of the last device on the daisy chain.

Figure 6  Wiring of Downstream and Upstream Devices

Figure 7  Installing the 3090MCTAS485 Terminator
POWER CONNECTION

**DANGER**

HAZARD OF ELECTRIC SHOCK, EXPLOSION, OR ARC FLASH

- Apply appropriate personal protective equipment (PPE) and follow safe electrical work practices. See NFPA 70E.
- This equipment must be installed and serviced only by qualified personnel.
- Turn off all power supplying this equipment and the equipment it is to be mounted inside before working on or inside equipment.
- Always use a properly rated voltage sensing device to confirm that power is off.
- Replace all device doors and covers before turning on power to this equipment.

Failure to observe these instructions will result in death or serious injury.

To make the power connection, use either 120 Vac 2-wire or 12 Vdc connection as shown in Figure 8.

**SETUP**

**Entering the Password**

Use the Setup Mode to initialize and configure the display to the application requirements. The password for setup mode is “SELECT, DOWN, DOWN, SELECT, UP, UP” as shown in Figure 9. This password is fixed and cannot be changed.
**Setup**

---

**To Enter SET UP MODE**

Press Simultaneously **UP** and **DOWN**

Enter Password * * * * * * *

(SEELECT, DOWN, DOWN, SELECT, UP, UP)

---

**Figure 9** Entering the Password for Setup Mode

---

**Initializing a System**

To initialize a system, you must perform the Setup communications and Find Meters actions. See “Setup Communications Submenu” and “Find Meters Submenu”.

---

**Viewing the Setup Mode Submenus**

Once you are in the setup mode, press UP or DOWN buttons to view submenus and then press SELECT for the submenu you want. Figure 10 illustrates setup mode button functions.

---

---

**View System Info Submenu**

In setup mode, View System Info is the first submenu to display. Select “View System Info” for viewing information only (not modifying) such as the serial number or the customer support phone number. See Figure 11.

---

---

**Setup Operation Submenu**

Select “Setup Operation” to adjust operational parameters. Set backlight brightness for optimum visibility. You can set output relay and auxiliary input parameters based on the contact configuration of any (optional) remote devices. You can set the display to automatically rotate through the readings or you can rotate manually. See “Monitoring Mode” for details. Refer to Figure 12 for Setup Operation parameters.
SETUP OPERATION

Show next parameter.  Show previous parameter.  Select  Meter  Return to setup menu.

Operation Parameters
- Backlight Brightness (0-9), 0 = Backlight OFF
- Output Relays (ALARM = OPEN, ALARM = CLOSED)
- Auxiliary Input (ALARM = OPEN, ALARM = CLOSED)
- Rotate Parameters (YES, NO). See “Monitoring Mode”

Figure 12  Setup Operation Button Functions

SETUP COMMUNICATIONS

Show next parameter.  Show previous parameter.  Select  Meter  Return to setup menu.

Communication Parameters
- Modbus Address (1-247)
- Upstream Type (RS-485, RS-232)
- Upstream Duplex (2-wire, 4-wire). Not available for RS-232.
- Upstream Baudrate (2400, 4800, 9600, 19,200).
- Upstream Parity (NONE, ODD, EVEN).
- Downstream Duplex (2-wire, 4-wire)
- Downstream Baudrate (2400, 4800, 9600, 19,200)
- Downstream Parity (NONE, ODD, EVEN)

Figure 13  Setup Communication Button Functions

Setup Communications Submenu
Select “Setup Communications” to adjust communications parameters. You must set downstream communications parameters to match the communications parameters of the downstream devices. When using an upstream master PC or control panel, you must set the appropriate Modbus address and upstream communications parameters. Refer to Figure 13.

Find Meters Submenu
From Setup mode, selecting “Find Meters” initiates a search and identifies devices on the network. Exit the search by pressing any key. To make sure all meters are accounted for, do not exit until all active addresses have been counted.

Unsupported devices will be designated as “unknown device” and parameters will not be displayed. See Table 3 on page 16 for supported devices.

Review Meters Submenu
From Setup mode, selecting “Review Meters” allows you to review all attached devices detected by the display. When you press REVIEW METERS, you see the first device found in the network. If the display does not detect any devices, you get a “No Meters” message.

The following are example displays of devices detected by the FIND METERS function:

Example display for an MCM6384 meter:

```
AD=002 BRD1 MTR7
MULTI-CRCT PRW 8
```

where AD=002 indicates Modbus address 2, BRD1 is the board name, and MTR7 is the meter name.
Example display for a BCM42 monitor:

\[
\begin{align*}
AD=061 & \quad BRD1 \\
\text{BRANCH CRCT AMPS}
\end{align*}
\]

where \(AD=061\) indicates Modbus address 061 and \(BRD1\) is the board name.

Example display for an Alta RH/Temp sensor:

\[
\begin{align*}
AD=216 & \\
\text{ALTA RH/TEMP}
\end{align*}
\]

Example display for an unsupported device:

\[
\begin{align*}
AD=123 & \\
\text{UNKNOWN DEVICE}
\end{align*}
\]

- Press UP to view the next meter. Continue pressing UP to scroll through the devices.
- Press METER to return to the setup menu.

**Status LED and Relay Operation**

The Status LED color (item 17, Figure 2) indicates the condition of the alarm registers. The output relays always indicate the state of the LED. See Table 2.

<table>
<thead>
<tr>
<th>LED Color</th>
<th>Relay 1</th>
<th>Relay 2</th>
<th>Cause</th>
</tr>
</thead>
<tbody>
<tr>
<td>Green</td>
<td>OFF</td>
<td>OFF</td>
<td>No Alarms or Warnings, No Aux. Input</td>
</tr>
<tr>

<td>ON</td>
<td>OFF</td>
<td>BCM Critical Alarm, MCM Non-Critical Alarm</td>
</tr>
<tr>
<td>Red</td>
<td>OFF</td>
<td>ON</td>
<td>MCM Critical Alarm, Aux. Input</td>
</tr>
</tbody>
</table>

**Monitoring Mode**

Monitoring is the default mode for the Sub Meter Display. You can set up the display to automatically rotate (scroll) through parameters or you can set it to display a selected parameter continuously. You do this by selecting either Yes or No for “Rotate Parameters” in the Setup Operation submenu (see Figure 12). When set to Yes for “Rotate Parameters” the display automatically rotates through the parameters of all supported devices and updates every four seconds. You can press SELECT to hold a reading to allow time to manually record the reading. When the reading is in hold, it will not be updated. Press any other button to return to monitoring mode (the display resumes automatically rotating through parameters of all supported devices). Figure 14 shows the monitoring mode button functions.
Viewing and Resetting Alarms

Alarm mode provides a means of viewing and resetting warning and critical alarms on the downstream network. To enter the alarm mode, press the Select and Meter buttons simultaneously. Figure 15 shows the alarm mode button functions.

TROUBLESHOOTING AND MAINTENANCE

If the display does not illuminate, check the fuses and voltage connections.

Changing the Battery

**WARNING**

HAZARD OF ELECTRIC SHOCK, EXPLOSION OR ARC FLASH

- Apply appropriate personal protective equipment (PPE) and follow safe electrical work practices. See NFPA 70E.
- Turn off all power supplying this equipment and the equipment it is mounted inside before working on or inside equipment.
- Always use a properly rated voltage sensing device to confirm that power is off.
- Replace onboard lithium backup battery only with the same or equivalent type recommended by the manufacturer.
- Dispose of battery according to the manufacturer’s instructions.

*Failure to follow these instructions can result in death or serious injury.*

To change the onboard lithium backup battery (item 2, Figure 2 on page 3), follow these steps:

1. Verify that the power supply to the display is turned off.
2. Remove the old lithium battery, taking care not to short the battery terminals.
3. Install the new lithium battery (same or equivalent type recommended by the manufacturer).
4. Turn on the power supply to the display.

Changing the Fuse

If the fuse is blown, use only 250 Vac / 200 mA, Fast, 5x20 mm. Follow these steps to replace it:

1. Verify that the power supply to the display is turned off.
2. Remove the old fuse and replace it with the new one.
3. Turn on the power supply to the display.
