

## Selectivity Guidelines for Square D™ Panelboards

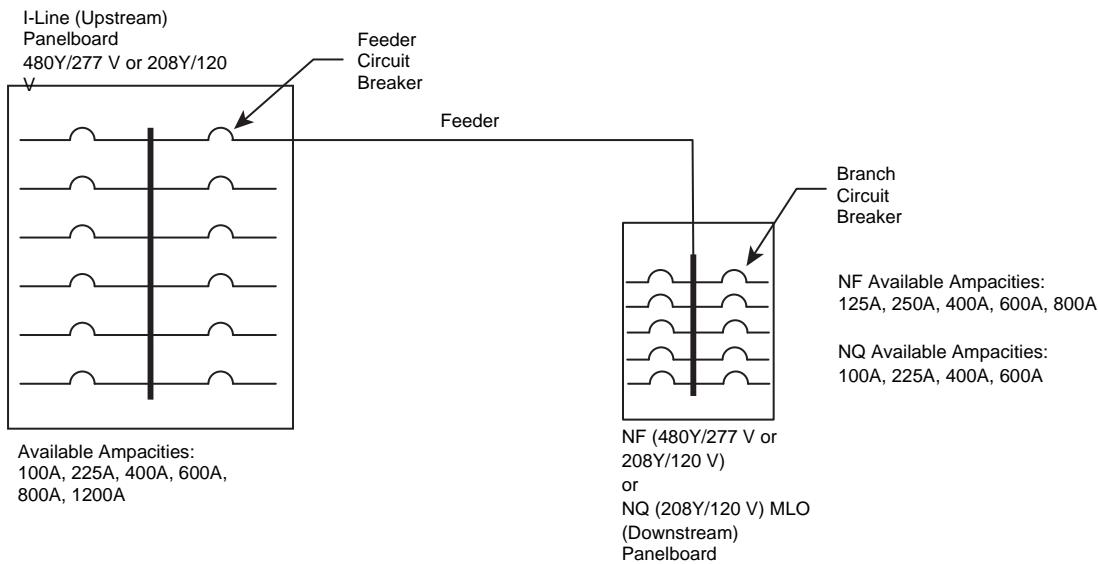

Retain for future use.

### Introduction

The natural advantages of circuit breakers make them the logical choice for overcurrent protection. Requirements in the National Electrical Code™ make it advantageous to consider selective coordination at the beginning of the design process. This guide is intended to facilitate the design of selectively coordinated systems when using Square D™ I-Line™, NF and NQ panelboards.

In this guide, the specific application of circuit breakers in Square D I-Line, NF, and NQ panelboards at the 480 V and 208 V levels are considered. Information from Data Bulletin 0100DB0501, *Short Circuit Selective Coordination for Low Voltage Circuit Breakers* is utilized, along with TCC comparisons where necessary. The result is a set of tables which allow for easy and efficient selection of Square D panelboards and their overcurrent devices. Two specifications for "selective coordination" are considered: coordination from 0.1s–1000s, and total selective coordination. The specification that is used will depend upon the NEC and other code requirements of the installation and the interpretation of these requirements by the authority having jurisdiction.

The tables herein may be used to select feeder and branch circuit breakers that will be selectively coordinated when NF and NQ panelboards are used in a configuration as illustrated below:

Alternatively, the upstream panelboard may be an I-Line section incorporated into a QED-2 switchboard.

## Listing of Tables

Downstream Panelboard Type:	Upstream Panelboard Type: I-Line			
	480Y/277 V 0.1s - 1000s	Total Selectivity	208Y/120 V 0.1s - 1000s	Total Selectivity
NF	Table 1	Table 2	Table 3	Table 4
NQ	N/A	N/A	Table 5	Table 6

**To find the table which applies to your application:**

Select a downstream panelboard type in the left-hand column. Read across the row to find the table which is listed under the appropriate voltage level and selectivity specification. For example, if the downstream panelboard is a NF panelboard, the appropriate table for total selectivity at 480Y/277 V is Table 2.

## Assumptions

- All thermal-magnetic circuit breakers with adjustable instantaneous trip settings are assumed to have their instantaneous settings at maximum.
- Electronic-trip circuit breakers are assumed to have the smallest sensor/rating plug size which meets or exceeds the ampacity requirements of the given circuit (exceptions in each table are noted with a footnote). The long-time trip/delay must be set to the appropriate level to give the circuit breaker trip setting shown. The instantaneous function is assumed to be turned off, if possible for the circuit breakers under consideration, or otherwise set to its maximum available setting. Electronic-trip circuit breakers are assumed to have a short-time function, and the short-time pickup and delay settings are assumed to be set at maximum.
- All circuit breakers are shown with their maximum available ampacity ranges. For most circuit breakers, these apply for 2- or 3-pole configurations, although this is not always the case. The availability of a given circuit breaker ampacity for a given model and configuration must be double-checked.

## How To Use The Tables

**If feeder size is known:**

1. **Locate Feeder Size/Upstream Panelboard Circuit Breaker Size** in leftmost column.
2. **Required Downstream Panelboard Ampacity** is in next column to right.
3. Follow row to right and select the closest **Maximum Available Fault Current at Upstream Panelboard** which is greater than or equal to the available fault current at upstream panelboard (adjust available fault current value if necessary due to system X/R ratio - see table explanatory notes).
4. Follow row to right and select an **Upstream Panelboard Feeder Circuit Breaker Type**.
5. Follow row to right to obtain the **Downstream Panelboard Branch Circuit Breaker Type** and the **Largest Possible Branch Circuit Breaker**. For "total coordination" tables, the **Maximum Available Fault Current at Downstream Panelboard** is also given. As long as the circuit breaker type and maximum size are adhered to (and the available fault current at the downstream panelboard is less than or equal to the value shown for "total coordination" tables), selective

coordination will be achieved as per the coordination parameters for the table.

6. If results do not yield a branch circuit breaker size which is large enough, repeat steps 4 and 5 using a different **Upstream Panelboard Feeder Circuit Breaker Type**.
7. If results do not yield a branch circuit breaker size which is large enough (or an acceptable level of fault current at the downstream panelboard), a larger feeder will be required. Go to the next larger **Feeder Size/Upstream Panelboard Circuit Breaker Size** and repeat steps 1 through 6.
8. Repeat steps 1 through 7 until the desired branch circuit breaker size is obtained.

**If branch circuit size/branch circuit breaker size is known:**

1. Starting at top of table, scan **Largest Possible Branch Circuit Breaker** sizes in rightmost column. Select the first one that is greater than or equal to the desired branch circuit size. For "total coordination" tables, **Maximum Available Fault Current at Downstream Panelboard** must be greater than or equal to the actual fault current at the downstream panelboard.
2. When the desired branch circuit breaker is found, follow row to left. Make sure that the actual available fault current at the upstream panelboard is less than or equal to the **Maximum Available Fault Current at Upstream Panelboard** (adjust available fault current value if necessary due to system X/R ratio - see table explanatory notes).
3. The required **Downstream Panelboard Ampacity** and **Feeder Size/Upstream Panelboard Circuit Breaker Size** are as shown. This is the smallest feeder circuit breaker that will satisfy the coordination criteria for the table.
4. Scan the rightmost column for other instances of the required branch circuit breaker size and follow steps 1 through 3 again. The feeder circuit/I-Line feeder circuit breaker size may be larger, but the I-Line circuit breaker may be less expensive.

## X/R Ratio Adjustment

All **Available Fault Currents** in the tables are given in RMS symmetrical amperes. For a system X/R ratio greater than the test X/R ratio of the circuit breaker in question, the available fault current equivalent RMS symmetrical duty for comparison with the values in the tables must be adjusted by a multiplying factor.

See IEEE Std. 242-2001 (Buff Book), IEEE Std. 1015-1997 (Blue Book) or NEMA AB 3-2001 for details.

Molded Case Circuit Breaker Interrupting Rating	Test X/R
Greater than 20kA	4.9
10kA - 20kA	3.2
Less than 10kA	1.7

Note that this is a consideration for circuit breaker fault duty rather than for selective coordination.

<sup>1</sup> Available fault currents are based upon system X/R ratios less than or equal to the circuit breaker test X/R ratio. See the explanatory note for X/R Ratio Adjustment on Page 3 for additional information.

<sup>2</sup> The PowerPact™ H-, J- and L-frame circuit breakers with Micrologic™ trip units (3.2/3.3 L,I and 5.2/5.3 L,S,I only) are denoted with the "U" character in the third position.

<sup>3</sup> The PowerPact J- and L-frame Mission Critical circuit breakers are denoted as J\_-W and L\_-W.

<sup>4</sup> PowerPact PG and PK circuit breakers smaller than 200 A cannot accept wires smaller than #3/0 AWG.

<sup>5</sup> PowerPact PK circuit breakers can be used wherever PG circuit breakers are mentioned in the table.

<sup>6</sup> The PowerPact P-Frame circuit breaker is available with ET1.0 or Micrologic™ 3.0/5.0/6.0 trip units in this size range:

PG (ET1.0) = ET1.0 trip unit

PG = Micrologic 3.0/5.0/6.0 trip unit

			MJ	ED	65	125

<sup>1</sup> Available fault currents are based upon system X/R ratios less than or equal to the circuit breaker test X/R ratio. See the explanatory note for X/R Ratio Adjustment on Page 3 for additional information.

<sup>2</sup> Values in red are taken from data bulletin 0100DB0501; all other values in this column are generated via TCC comparison.

<sup>3</sup> PowerPact PG and PK circuit breakers smaller than 200 A cannot accept wires smaller than #3/0 AWG.

<sup>4</sup> PowerPact PK circuit breakers can be used wherever PG circuit breakers are mentioned in the table.

<sup>5</sup> The PowerPact J- and L-frame Mission Critical circuit breakers are denoted as J\_-W and L\_-W.

<sup>6</sup> The PowerPact P-frame circuit breaker is available with ET1.0 or Micrologic 3.0/5.0/6.0 trip units in this size range:

PG (ET1.0) = ET1.0 trip unit

PG = Micrologic 3.0/5.0/6.0 trip unit

<sup>7</sup> Requires larger sensor size if standard rating plug is used (300 A: 600 A w/ LTPU=0.5, 450 A: 1000 A w/LTPU=0.45, 500 A: 800 A w/LTPU=0.625, 700 A: 1000 A w/LTPU= 0.7).

**Table 3: I-Line/NF Panelboard Selective Coordination at 208Y/120 V — 0.1s to 1000s (continued)**

Feeder Size / Upstream (I-Line) Panelboard Circuit Breaker Size (A)	Required Downstream (NF) Panelboard Ampacity (A)	Maximum Available Fault Current at Upstream (I-Line) Panelboard (kA RMS Sym.) <sup>1</sup>	Upstream (I-Line) Panelboard Feeder Circuit Breaker Type	Downstream (NF) Panelboard Branch Circuit Breaker Type <sup>2</sup>	Largest Possible Branch Circuit Breaker (A)
800	800	25	MG, PG (ET1.0) <sup>9, 7</sup> , PG <sup>9, 7</sup>	ED	125
		65	MG, PG (ET1.0) <sup>9, 7</sup> , PG <sup>9, 7</sup>	EG	125
		100	MJ, PJ (ET1.0 <sup>9</sup> , PJ <sup>9</sup> )	EJ	125

<sup>1</sup> Available fault currents are based upon system X/R ratios less than or equal to the circuit breaker test X/R ratio. See the explanatory note for X/R Ratio Adjustment on Page 3 for additional information.

<sup>2</sup> 2 Pole or 3 Pole 15–125 A only. 1 Pole is available from 15–70 A and has an AIR of 18 kA for ED, 35 kA for EG, and 65 kA for EJ.

<sup>3</sup> 480 V-rated.

<sup>4</sup> The PowerPact H-, J- and L-frame circuit breakers with Micrologic trip units (3.2/3.3 L,I and 5.2/5.3 L,S,I only) are denoted with the "U" character in the third position.

<sup>5</sup> The PowerPact J- and L-frame Mission Critical circuit breakers are denoted as J\_-W and L\_-W.

<sup>6</sup> PowerPact PG and PK circuit breakers smaller than 200 A cannot accept wires smaller than #3/0 AWG.

<sup>7</sup> PowerPact PK circuit breakers can be used wherever PG circuit breakers are mentioned in the table.

<sup>8</sup> Requires larger sensor size if standard rating plug is used (300 A: 600 A w/ LTPU=0.5, 450 A: 1000 A w/LTPU=0.45, 500 A: 800 A w/LTPU=0.625, 700 A: 1000 A w/LTPU= 0.7).

<sup>9</sup> The PowerPact P-frame circuit breaker is available with ET1.0 or Micrologic 3.0/5.0/6.0 trip units in this size range:

PG (ET1.0) = ET1.0 trip unit

PG = Micrologic 3.0/5.0/6.0 trip unit

		100	MJ, PJ (ET1.0) <sup>5</sup> , PJ <sup>5</sup>	ED	100	125

<sup>1</sup> Available fault currents are based upon system X/R ratios less than or equal to the circuit breaker test X/R ratio. See the explanatory note for X/R Ratio Adjustment on Page 3 for additional information.

<sup>2</sup> 2 Pole or 3 Pole 15–125 A only. 1 Pole is available from 15–70 A and has an AIR of 18 kA for ED, 35 kA for EG, and 65 kA for EJ.

<sup>3</sup> PowerPact PG and PK circuit breakers smaller than 200 A cannot accept wires smaller than #3/0 AWG.

<sup>4</sup> PowerPact PK circuit breakers can be used wherever PG circuit breakers are mentioned in the table.

<sup>5</sup> The PowerPact P-frame circuit breaker is available with ET1.0 or Micrologic 3.0/5.0/6.0 trip units in this size range:

PG (ET1.0) = ET1.0 trip unit

PG = Micrologic 3.0/5.0/6.0 trip unit

<sup>6</sup> Requires larger sensor size if standard rating plug is used (300 A: 600 A w/LTPU=0.5, 450 A: 1000 A w/LTPU=0.45, 500 A: 800 A w/LTPU=0.625, 700 A: 1000 A w/LTPU=0.7).

<sup>7</sup> The PowerPact J- and L-frame Mission Critical circuit breakers are denoted as J-W and L-W.

<sup>1</sup> Available fault currents are based upon system X/R ratios less than or equal to the circuit breaker test X/R ratio. See the explanatory note for X/R Ratio Adjustment on Page 3 for additional information.

<sup>2</sup> The PowerPact H-, J- and L-frame circuit breakers with Micrologic trip units (3.2/3.3 L,I and 5.2/5.3 L,S,I only) are denoted with the "U" character in the third position.

<sup>3</sup> The PowerPact J- and L-frame Mission Critical circuit breakers are denoted as J\_-W and L\_-W.

<sup>4</sup> PowerPact PG and PK circuit breakers smaller than 200 A cannot accept wires smaller than #3/0 AWG.

<sup>5</sup> PowerPact PK circuit breakers can be used wherever PG circuit breakers are mentioned in the table.

<sup>6</sup> 480 V-rated.

<sup>7</sup> 2P or 3P only. QO-VH 1P is available up to 30 A (and coordinates up to 30 A).

<sup>8</sup> The PowerPact P-frame circuit breaker is available with ET1.0 or Micrologic 3.0/5.0/6.0 trip units in this size range:

PG (ET1.0) = ET1.0 trip unit

PG = Micrologic 3.0/5.0/6.0 trip unit

<sup>9</sup> 2 Pole only. QO 1P is available up to 70 A (and coordinates up to 70 A). QO 3P is available up to 100 A (and coordinates up to 100 A).

<sup>10</sup> 2 Pole or 3 Pole only. QO 1P is available up to 70 A (and coordinates up to 70 A).

<sup>11</sup> Requires larger circuit breaker size if standard rating plug is used (300 A: 600 A w/ LTPU=0.5, 450 A: 1000 A w/LTPU=0.45, 500 A: 800 A w/LTPU=0.625).

<sup>12</sup> Requires larger circuit breaker size if standard rating plug is used (300 A: 600 A w/ LTPU=0.5, 450 A: 1000 A w/LTPU=0.45, 500 A: 800 A w/LTPU=0.625).

<sup>1</sup> Available fault currents are based upon system X/R ratios less than or equal to the circuit breaker test X/R ratio. See the explanatory note for X/R Ratio Adjustment on Page 3 for additional information.

<sup>2</sup> Values in red are taken from data bulletin 0100DB0501; all other values in this column are generated via TCC comparison.

<sup>3</sup> PowerPact PG and PK circuit breakers smaller than 200 A cannot accept wires smaller than #3/0 AWG.

<sup>4</sup> PowerPact PK circuit breakers can be used wherever PG circuit breakers are mentioned in the table.

<sup>5</sup> The PowerPact J- and L-frame Mission Critical circuit breakers are denoted as J\_-W and L\_-W.

<sup>6</sup> 2 Pole or 3 Pole only. QO-VH 1P is available up to 30 A (and coordinates up to 30 A).

<sup>7</sup> 2 Pole or 3 Pole only. QO 1P is available up to 70 A (and coordinates up to 70 A).

<sup>8</sup> The PowerPact P-frame circuit breaker is available with ET1.0 or Micrologic 3.0/5.0/6.0 trip units in this size range:  
PG (ET1.0) = ET1.0 trip unit  
PG = Micrologic 3.0/5.0/6.0 trip unit

<sup>9</sup> 2 Pole only. QO 1P is available up to 70A (and coordinates up to 70A), QO, 3P is available up to 100A (and coordinates up to 100A).

<sup>10</sup> Requires larger breaker size if standard rating plug is used (300A: 600A w/ LTPU=0.5, 450A: 1000A w/LTPU=0.45, 500A: 800A w/LTPU=0.625).
