

# Wiser™

Connected Technology for Homes

## Android App Release (v1.3.10)

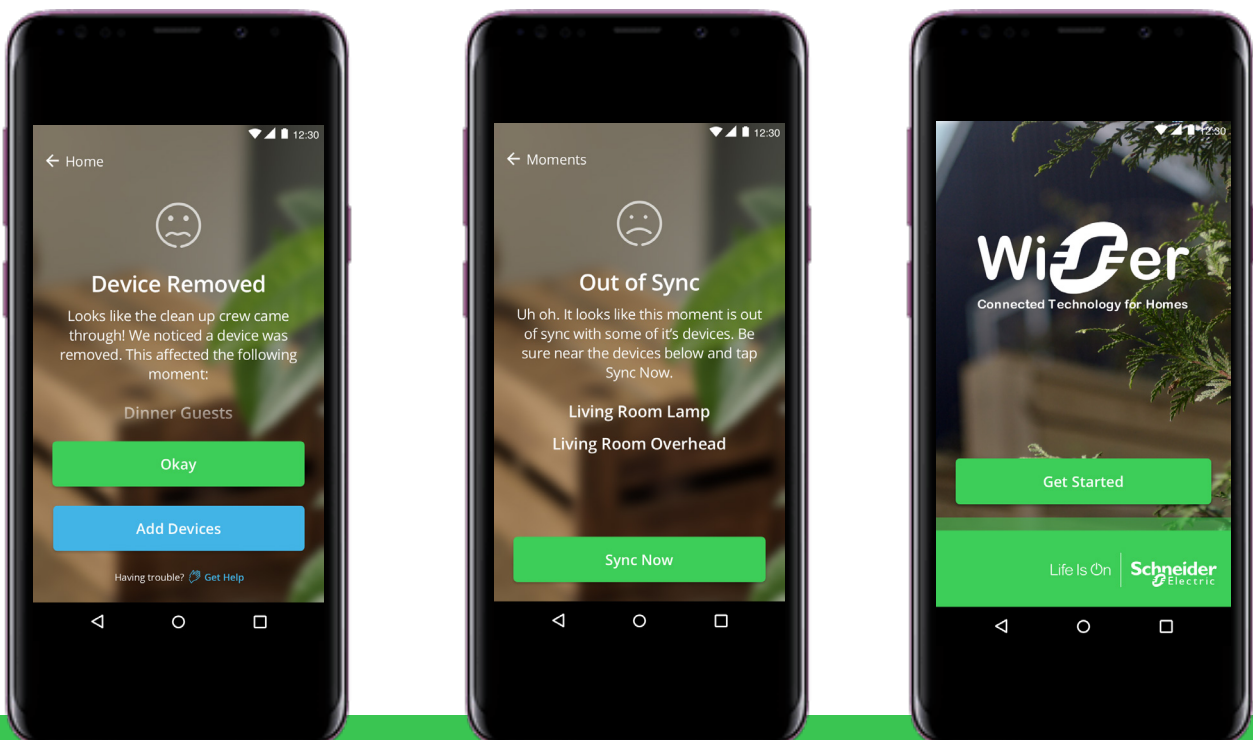

We're pleased to announce the latest and improved Wiser App for **Android**.

We have made multiple improvements in the overall App usability, interactions with moments and added new functions.

## Moments, Notifications and Reliability Improvements

- You will see significant improvements in the overall usability of the App.
- Major improvements in the time required to save multiple moments in the App. You can now save your favourite moments quicker to control your lights, open your shutters etc.
- You now have the ability to delete a moment. Triggers can now be deleted for end-devices.
- You will now be notified when a moment cannot be activated if a device is out of reach.
- You can now add 2-channel light devices with moments.
- Upon opening the App you will see our cool new logo.

# Known Limitations

- **Huawei phones** and other manufacturers than Google/Samsung may take longer to save due to BLE limitation from the device.
- When a user reaches the max number of **schedules (16)** on an end-device, there is no mechanism in place to prevent the user from creating a moment with a schedule. The moment will not work for the specific end-device. This use case will need to be improved in the next few weeks.
- Executing a **moment** might still take some time and will be improved once this portion of code is moved to the new SDK.
- Reliability problem when swap **BLE to ZBE** has been identified in some cases.
- Time to save a **moment** may vary from one phone to another: from 15 seconds up to 50 seconds.
