Airflow and Noise Level

Forced-air cooling is by axial metal-bladed aerofoil fans, giving vertical discharge. Two fans are fitted.
Typical noise level is 85dBA at 50Hz. Measurements are taken 3 metres from the load bank and at 90° to the airflow direction. Noise readings are subject to a tolerance of ±3dBA.

Load Control

The resistive elements and inductors are connected to the supply on test by electro-mechanical contactors fitted internally within the load bank. These are controlled by the SIGMA load control system.

For comprehensive information on SIGMA control please see separate data sheet and system layout diagram for further details.

Construction

The load bank equipment is housed within 10ft ISO style container. Container structure is made from carbon steel, the roof from 4.5mm and the floor from inverted 6mm MS chequer plate.
To minimise condensation the roof is internally lined with 50mm, 45kg/m³, mineral wool, held in place with 22SWG pre galvanised perforated sheet.
Fitted with standard ISO lifting points and supplied with the CSC certification for top-loading shipping. Optional Padetype lifting points are available without certification in the roof.
Formed from 2mm Galvatite steel the double skinned, vertical discharge duct with aluminised steel heat shield contains the resistive load elements and cooling fans below equipped with hot-dipped galvanised air inlet grilles to provide protection to IP2X. Stainless steel mesh screens on the hot air discharge provide protection against hazardous parts to IP1X.
Side and end louvers with steel mesh grilles allow air inlet and protection to IP1X.
The side personnel door allows entry to the walk-in control room where full access can be gained to the control and switchgear cabinets and if specified the power circuit breakers. Internal cabinets are manufactured from 2mm ‘Zintec’ steel.
The power termination enclosure forms a convenient table-top for PC operation. All electrical enclosures are to IP54.
Full height end double doors and small access doors on the sides provide easy access for routine maintenance.

Finish

Container
All surfaces are degreased and shot blasted to S.A. 2.5 for excellent paint adhesion. All surfaces excluding the floor are applied with a primer to 75 microns D.F.T. and top coat two-pack epoxy/acrylic 40 microns D.F.T. Standard top coat colour is white (RAL9001). Other colours are available on request. The floor is painted internally with Red Oxide 50 microns D.F.T and the exterior underside with Mercasol 3ART4 100 microns D.F.T.

Internal Control Room Cabinets
High quality two-pack industrial acrylic paint system applied to an electro-plated zinc base and low-bake finish. Standard colour is grey (RAL7042). Other colours are available on request.

Warranty
The equipment is covered by a 12-month warranty as detailed in our Conditions of Trade.

The ASCO Model 8100 are resistive containerized load banks designed for outdoor installation when up to 2850 kW of electrical load is required.

Safety Features

An emergency stop/disconnect switch gives full isolation of the fan and control supply. A 110 Volt AC control circuit transformer provides isolation and operator safety. Stop/start buttons ensure the load bank will not automatically restart. On static load banks provision is also made for the connection of remote stop/start buttons. The fan motor is fully protected with fuses and a thermal overload. Movable load banks are also fitted with phase rotation detection to automatically ensure correct airflow direction. Single phasing protection is provided by the overload.

Thermal detectors are fitted to protect against overheating in the resistive ducts, inductors and switchgear compartments. Over voltage protection for the control and load circuit is provided by SIGMA load control. Each element group and its associated contactor are protected by an HRC fuse. This is very important when testing large capacity power supplies, due to the possible high fault currents.

The load contactors are interlocked with the fan controls to ensure load can be applied only when the fan is running.

Internal access is restricted by key operated door catches. Polycarbonate screens behind the doors prevent accidental contact with live parts.

Voltage Rating

Resistive elements and inductors are continuously rated at the specific voltage and frequency stated on our quotation document. Short-term tests with fluctuations up to 10% above rated voltage are permissible. Tests at lower voltages, with a corresponding reduction in overall rating, may be carried out. Power is proportional to voltage squared. Inductors rated at 50Hz can also be used on 60Hz, but not vice versa. Resistive elements are suitable for both 50 and 60Hz operation.

Ambient Temperature and Humidity

Standard load banks are rated at 35°C, when protected from solar radiation. Load banks rated at 50°C are also available. Ambient humidity may be up to 90% RH, non-condensing.

Power Terminals, Cable Entry & Earthing

Power terminals are located behind a dedicated door. A neutral terminal is fitted for instrumentation purposes only. The Protective Earth (PE) point is also located in this area. M12 earth bonding points are located externally adjacent to all four corners. Static load banks are fitted with a blank non-ferrous gland plate(s).

Moveable load banks are fitted with non-metallic gland plate(s) with a flexible pvc cable sock, to enable safe temporary power connections to be easily made in a controlled test environment. A blank non-ferrous gland plate is also supplied to enable a fully compliant installation to IP54 if necessary. The 8100 is equipped with one gland plate side access point. The size of these openings is 450 x 280mm.

There is additional plate under the floor of the terminal area measuring 610 x 213mm.

Three Phase Auxiliary Supply

The fan and control circuit may be powered from an external auxiliary supply or from the supply on test, provided it is of the correct voltage and frequency. Lower voltages and other frequencies must be tested using the external supply. On static load banks, connection is by internal terminals. On movable load banks, a IEC 60309-2 plug and socket with a three-position switch enables quick and easy connection.

Single Phase Auxiliary Supply

This provides power for the anti-condensation, internal lighting and single phase sockets detailed below.

On static load banks, connection is by internal terminals. On movable load banks, an IEC 60309-2 plug and socket with a three-position switch enables quick and easy connection.

International load banks require a 220-240V 1ph 50Hz supply. Load banks to North America require 120V 1ph 60Hz supply.

Anti-Condensation Heaters

Anti-condensation heaters are fitted within the control and switch gear cabinets and controlled by thermostats.

An additional heater is located in the control cabinet and powered from the isolated 110-120V control circuit supply.

Internal Lighting

Bulkhead fittings are provided to give illumi-nation inside the containers. Lights are sited in the control room, behind service access doors and the main power connection area.

As this equipment is often utilised for hire and often night-time working the supplied lighting makes the working environment user friendly. Power for the lighting is supplied from either the single-phase auxiliary supply or from the fan and control circuit supply. A three-position switch enables quick and easy selection on moveable load banks and an on/off switch is fitted to static.
Model 8100 Specifications

**Internal Single Phase Socket Outlets**

The control room is equipped with single-phase socket outlets. These may be used to power a PC to operate the load bank. International load banks are fitted with two sockets. One is a 13 amp square pin, the other a European round pin socket. One 5 amp RCD protection device backs both units. Load banks to North American specification are supplied with one US type 2 flat blade and earth socket backed by a RCD protection device.

**Options**

**Power Isolation**

Power air circuit breakers complying to IEC standard allow the load bank to be fully isolated from the supply on test. The circuit breakers provide short circuit, overload and earth fault protection. A shunt trip facility is also fitted to allow tripping from a remote location. Dual UL/IEC standard circuit breakers are also available.

**Air Inlet Louvre Covers**

Metal hinged covers may be closed over the louvers on the sides and ends of the container to prevent rain and road dirt from entering in harmful quantities during long-distance transportation. When closed they are secured shut by key operated latches. For load bank operation all covers must be opened and are held in position by gas struts. The overall dimensions of the standard ISO container are maintained.

**Documentation – Operator Handbook**

A comprehensive illustrated operator’s manual is supplied. Sections cover safety, installation, commissioning, operation, calibration, maintenance and fault finding.

**Testing and Standards**

Functional operation and load tests are completed on all load banks, before despatch, in line with our ISO 9001:2008 procedures. ASCO load banks comply with international standards and are CE marked to confirm compliance with both the EMC and Low Voltage Directives.
