All Compact NS800-3200 and Masterpact NT and NW circuit breakers are equipped with a Micrologic control unit that can be changed on site. Control units are designed to protect power circuits and connected loads.

### Micrologic 2.0: basic protection

- **X**: type of protection
  - 2 for basic protection
  - 5 for selective protection
  - 6 for selective + earth-fault protection
  - 7 for selective + earth-leakage protection.

- **Y**: version number
  Identification of the control-unit generation.
  "0" signifies the first generation.

- **Z**: type of measurement
  - A for "ammeter"
  - P for "power meter"
  - H for "harmonic meter"
  - no indication = no measurements.

### Micrologic 5.0: selective protection

- **X**: type of protection
  - 2 for basic protection
  - 5 for selective protection
  - 6 for selective + earth-fault protection
  - 7 for selective + earth-leakage protection.

- **Y**: version number
  Identification of the control-unit generation.
  "0" signifies the first generation.

- **Z**: type of measurement
  - A for "ammeter"
  - P for "power meter"
  - H for "harmonic meter"
  - no indication = no measurements.

### Micrologic 6.0: selective + ground-fault protection

- **X**: type of protection
  - 2 for basic protection
  - 5 for selective protection
  - 6 for selective + earth-fault protection
  - 7 for selective + earth-leakage protection.

- **Y**: version number
  Identification of the control-unit generation.
  "0" signifies the first generation.

- **Z**: type of measurement
  - A for "ammeter"
  - P for "power meter"
  - H for "harmonic meter"
  - no indication = no measurements.

Overview of functions
Current protection

Protection settings
Depending on the type of installation, it is possible to set the tripping curve of your control unit using the parameters presented below.

Micrologic 2.0

- 1. Current setting \( I_r \) (long time)
- 2. Tripping delay \( t_r \) (long time) for \( 6 \times I_r \)
- 3. Pick-up \( Isd \) (instantaneous)

Micrologic 5.0 and 6.0

- 1. Current setting \( I_r \) (long time)
- 2. Tripping delay \( t_r \) (long time) for \( 6 \times I_r \)
- 3. Pick-up \( Isd \) (short time)
- 4. Tripping delay \( tsd \) (short time)
- 5. Pick-up \( Ii \) (instantaneous)

Micrologic 6.0

- 1. Pick-up \( Ig \) (ground fault)
- 2. Delay \( t \) (ground fault)

Long-time protection
The long-time protection function protects cables (phases and neutral) against overloads. This function is based on true rms measurements.

Thermal memory
The thermal memory continuously accounts for the amount of heat in the cables, both before and after tripping, whatever the value of the current (presence of an overload or not). The thermal memory optimises the long-time protection function of the circuit breaker by taking into account the temperature rise in the cables. The thermal memory assumes a cable cooling time of approximately 15 minutes.

### Long-time current setting \( I_r \) and standard tripping delay \( t_r \)

(*): In circuit breaker rating
(1): 0 to - 40%
(2): 0 to - 60%

Setting accuracy of the \( I_r \) setting may be enhanced by using a different long-time rating plug.
See the technical appendix "Changing the long-time rating plug".

Overload LED
This LED signals that the long-time current setting \( I_r \) has been overrun.
Overview of functions

Current protection

Short-time protection

- The short-time protection function protects the distribution system against impedant short-circuits.
- The short-time tripping delay can be used to ensure discrimination with a downstream circuit breaker.
- This function carries out true rms measurements.

- The I^2t ON and I^2t OFF options enhance discrimination with downstream protection devices.
- Use of I^2t curves with short-time protection:
  - I^2t OFF selected: the protection function implements a constant time curve
  - I^2t ON selected: the protection function implements an I^2t inverse-time curve up to 10 I_r. Above 10 I_r, the time curve is constant.

Short-time pick-up Isd and tripping delay tsd

</tr>
<tr>
<td>I^2t Off</td>
<td>tsd (max break time) 80 140 200 320 500</td>
</tr>
</tbody>
</table>

Instantaneous protection

- The instantaneous-protection function protects the distribution system against solid short-circuits. Contrary to the short-time protection function, the tripping delay for instantaneous protection is not adjustable.
- The tripping order is sent to the circuit breaker as soon as current exceeds the set value, with a fixed time delay of 20 milliseconds.
- This function carries out true rms measurements.

Neutral protection on four-pole circuit breakers

Protection of the neutral conductor depends on the distribution system.

There are three possibilities:

<table>
<thead>
<tr>
<th>Type of neutral</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Neutral unprotected</td>
<td>The distribution system does not require protection of the neutral conductor.</td>
</tr>
<tr>
<td>Neutral protection at 0.5 In</td>
<td>The cross-sectional area of the neutral conductor is half that of the phase conductors.</td>
</tr>
<tr>
<td></td>
<td>- The long-time current setting Ir for the neutral is equal to half the setting value</td>
</tr>
<tr>
<td></td>
<td>- The short-time pick-up Isd for the neutral is equal to half the setting value</td>
</tr>
<tr>
<td></td>
<td>- The instantaneous pick-up Isd (Micrologic 2.0) for the neutral is equal to half the setting value</td>
</tr>
<tr>
<td></td>
<td>- The instantaneous pick-up Ii (Micrologic 5.0 and 6.0) for the neutral is equal to the setting value</td>
</tr>
<tr>
<td>Neutral protection at In</td>
<td>The cross-sectional area of the neutral conductor is equal to that of the phase conductors.</td>
</tr>
<tr>
<td></td>
<td>- The long-time current setting Ir for the neutral is equal to the setting value</td>
</tr>
<tr>
<td></td>
<td>- The short-time pick-up Isd for the neutral is equal to the setting value</td>
</tr>
<tr>
<td></td>
<td>- The instantaneous pick-ups Isd and Ii for the neutral are equal to the setting value</td>
</tr>
</tbody>
</table>

Neutral protection on three-pole devices

Neutral protection is not available on three-pole devices.

Ground-fault protection on Micrologic 6.0

- A ground fault in the protection conductors can provoke local temperature rise at the site of the fault or in the conductors.
- Ground-fault and neutral protection are independent and can therefore be combined.
- The purpose of the ground-fault protection function is to eliminate this type of fault.
- There are two types of ground-fault protection.

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Residual</td>
<td>- The function determines the zero-phase sequence current, i.e. the vectorial sum of the phase and neutral currents</td>
</tr>
<tr>
<td></td>
<td>- It detects faults downstream of the circuit breaker.</td>
</tr>
<tr>
<td>Source Ground Return</td>
<td>- Using a special external sensor, this function directly measures the fault current returning to the transformer via the earth cable</td>
</tr>
<tr>
<td></td>
<td>- It detects faults both upstream and downstream of the circuit breaker.</td>
</tr>
<tr>
<td></td>
<td>- The maximum distance between the sensor and the circuit breaker is ten metres.</td>
</tr>
</tbody>
</table>

Ground-fault pick-up Ig and tripping delay tg

The pick-up and tripping-delay values can be set independently and are identical for both the residual and "source ground return" ground-fault protection functions.

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

* In: circuit-breaker rating.
The battery maintains the fault indications. If there are no indications, check the battery.

*Overview of functions*

**Micrologic 6.0 fault indications**

Signals tripping due to an overrun of the long-time current setting Ir.

Signals tripping due to an overrun of the short-time pick-up Isd or the instantaneous pick-up Isd / Ii.

Signals tripping due to an overrun of the ground-fault pick-up Ig.

Signals tripping due to the auto-protection function of the control unit. The auto-protection function (excessive temperature or short-circuit higher than circuit breaker capacity) opens the circuit breaker and turns on the Ap LED.

**Important remark**

If the circuit breaker remains closed and the Ap LED remains on, contact the Schneider after-sales support department.
Important remark
With the 4P 3D setting, the current in the neutral must not exceed the rated current of the circuit breaker.

Selecting the type of neutral protection
On four-pole circuit breakers, it is possible to select the type of neutral protection using the three-position switch:

- Neutral unprotected (4P 3D)
- Neutral protection at 0.5 In (3D + N/2)
- Neutral protection at In (4P 4D).

Setting procedure
Using the adjustment dials

1. Open the protective cover.
2. Select the desired setting.
3. Close the protective cover and, if necessary, install a lead seal to protect the settings.
Setting the Micrologic 2.0 control unit

The rating of the circuit breaker in this example is 2000 A.

In = 2000 A

See pages 4, 5 and 6 for information on the available settings.

Set the threshold values

In = 2000 A
Ir = 0.7 x In = 1400 A
Isd = 3 x Ir = 4200 A

Set the tripping delay

tr = 1 second
Setting your control unit

The rating of the circuit breaker in this example is 2000 A.

Set the threshold values

In = 2000 A
Ir = 0.7 x In = 1400 A
Ird = 2 x Ir = 2800 A
Ii = 3 x In = 6000 A

Set the tripping delay

tr = 1 second
tsd = 0.2 seconds
Setting your control unit

Setting the Micrologic 6.0 control unit

The rating of the circuit breaker in this example is 2000 A.

Set the threshold values

\[
\begin{align*}
\text{In} & = 2000 \text{ A} \\
\text{Ir} & = 0.7 \times \text{In} = 1400 \text{ A} \\
\text{I}_{\text{sd}} & = 2 \times \text{Ir} = 2800 \text{ A} \\
\text{I}_{\text{i}} & = 3 \times \text{In} = 6000 \text{ A} \\
\text{B} & \rightarrow \text{I}_{\text{g}} = 640 \text{ A}
\end{align*}
\]

Set the tripping delay

\[
\begin{align*}
\text{tr} & = 1 \text{ s} \\
\text{tsd} & = 0.2 \text{ s} \\
\text{tg} & = 0.2 \text{ s}
\end{align*}
\]
Fault and status indications

Resetting the fault indications and checking battery status on Micrologic 6.0

The procedure for closing the circuit breaker following a fault trip is presented in the circuit-breaker user manual.

Resetting the fault indications

1. Determine why the circuit breaker tripped. The fault indication is maintained until it is reset on the control unit.
2. Press the fault-trip reset button.
3. Check the parameter settings of the control unit.

Checking the battery

1. Press the battery-test button (which is the same as the fault-trip reset button) to check the luminance of trip indicator light.
2. If trip indicators are dim or there is no luminance, then the battery needs to be changed.

Changing the control-unit battery

1. Remove the battery cover.
2. Remove the battery.
3. Insert a new battery. Check the polarity.
4. Put the cover back in place. Press the battery-test button to check the new battery.

If the battery needs to be changed, order a new battery with the Schneider catalogue number 33593.

- Lithium battery
- 1.2 AA, 3.6 V, 850 mA/h
- SAFT LS3 SONNENSCHIEIN TEL-S
- Service life ten years.
Testing the control unit

To test the control unit, connect the portable test kit via the test connector.

Testing the ground-fault protection on Micrologic 6.0

1. Charge and close the circuit breaker.
2. Using a screwdriver, press the test button for ground-fault protection.
   The circuit breaker should open.

Important remark
If the circuit breaker does not open, contact the Schneider after-sales support department.
**Long-time and instantaneous protection - Micrologic 2.0**

- $I_r = 0.4 \ldots 1 \times I_n$
- $t_r = 0.5 \ldots 24$ s
- $I_{sd} = 1.5 \ldots 10 \times I_r$

**Long-time, short-time and instantaneous protection - Micrologic 5.0 and 6.0**

- $I_r = 0.4 \ldots 1 \times I_n$
- $t_r = 0.5 \ldots 24$ s
- $I_{sd} = 1.5 \ldots 10 \times I_r$
Changing the long-time rating plug

Select the long-time rating plug
A number of setting ranges for the long-time current setting are available on Micrologic 2.0, 5.0 and 6.0 control units by changing the long-time rating plug. The available rating plugs are listed below:

<table>
<thead>
<tr>
<th>Part number</th>
<th>Setting range for the Ir value</th>
</tr>
</thead>
<tbody>
<tr>
<td>33542</td>
<td>standard 0.4 to 1 x Ir</td>
</tr>
<tr>
<td>33543</td>
<td>low setting 0.4 to 0.8 x Ir</td>
</tr>
<tr>
<td>33544</td>
<td>high setting 0.8 to 1 x Ir</td>
</tr>
<tr>
<td>33545</td>
<td>without long-time protection</td>
</tr>
</tbody>
</table>

Ir = In for the short-time protection setting

Important remark
Following any modifications to the long-time rating plug, all control-unit protection parameters must be checked.

Change the long-time rating plug
Proceed in the following manner.
1. Open the circuit breaker.
2. Open the protective cover of the control unit.
3. Completely remove the long-time rating plug screw.
4. Snap out the rating plug.
5. Clip in the new rating plug.
6. Refit the screw for the long-time rating plug.
7. Check and/or modify the control-unit settings.

If no long-time rating plug is installed, the control unit continues to operate under the following downgraded conditions:
- the long-time current setting Ir is 0.4, whatever the position of the adjustment dial
- the long-time tripping delay tr corresponds to the value indicated by the adjustment dial.
Thermal memory

The thermal memory is a means to simulate temperature rise and cooling caused by changes in the flow of current in the conductors.

These changes may be caused by:
- repetitive motor starting;
- loads fluctuating near the protection settings;
- repeated circuit-breaker closing on a fault.

Control units without a thermal memory (contrary to bimetal strip thermal protection) do not react to the above types of overloads because they do not last long enough to cause tripping.

However, each overload produces a temperature rise and the cumulative effect can lead to dangerous overheating.

Control units with a thermal memory record the temperature rise caused by each overload. Even very short overloads produce a temperature rise that is stored in the memory.

This information stored in the thermal memory reduces the tripping time.

Micrologic control units and thermal memory

All Micrologic control units are equipped as standard with a thermal memory.

- For all protection functions, prior to tripping, the temperature-rise and cooling time constants are equal and depend on the tripping delay in question:
  - if the tripping delay is short, the time constant is low;
  - if the tripping delay is long, the time constant is high.

- For long-time protection, following tripping, the cooling curve is simulated by the control unit. Closing of the circuit breaker prior to the end of the time constant (approximately 15 minutes) reduces the tripping time indicated in the tripping curves.

Short-time protection and intermittent faults

For the short-time protection function, intermittent currents that do not provoke tripping are stored in the Micrologic memory.

This information is equivalent to the long-time thermal memory and reduces the tripping delay for the short-time protection.

Following a trip, the short-time tsd tripping delay is reduced to the value of the minimum setting for 20 seconds.

Ground-fault protection and intermittent faults

The ground-fault protection implements the same function as the short-time protection.
