

This UPS provides advanced single telephone line or modem surge suppression through the modular connectors on the back panel.

Connect a single line telephone or a modem line into the telephone/modem surge protection sockets on the back of the UPS. The RJ-45/RJ-11 modular combination sockets accept all standard single line telephone connections. This connection will require another length of telephone cable (supplied). **Note:** This connection is optional. It is not needed to use the UPS.

CAUTION: The telephone line current limiting feature could be rendered inoperable if improperly installed. Ensure that the telephone cable from the wall is plugged into the connector marked "IN", and the device to be protected (telephone, modem, etc.) is plugged into the connector labelled "OUT".

Never install telephone wiring during a lightning storm.

Intended for indoor use only.
