Safety Information

Important Information

Read these instructions carefully and look at the equipment to become familiar with the device before trying to install, operate, service or maintain it. The following special messages may appear throughout this manual or on the equipment to warn of potential hazards or to call attention to information that clarifies or simplifies a procedure.

The addition of either symbol to a “Danger” or “Warning” safety label indicates that an electrical hazard exists which will result in personal injury if the instructions are not followed.

This is the safety alert symbol. It is used to alert you to potential personal injury hazards. Obey all safety messages that follow this symbol to avoid possible injury or death.

<table>
<thead>
<tr>

<tbody>
<tr>
<td>NOTICE is used to address practices not related to physical injury. The safety alert symbol shall not be used with this signal word.</td>
</tr>
</tbody>
</table>

Please note

Electrical equipment should be installed, operated, serviced and maintained only by qualified personnel. No responsibility is assumed by Schneider Electric for any consequences arising out of the use of this material.

A qualified person is one who has skills and knowledge related to the construction, installation, and operation of electrical equipment and has received safety training to recognize and avoid the hazards involved.

Firmware

This user guide is written to be used with firmware version 01.00.0 and higher. See “Identifying the Firmware Version, Model, and Serial Number” on page 103 for instructions on determining the firmware version.
Chapter 2—Safety Precautions

Before You Begin

Installation, wiring, testing and service must be performed in accordance with all local and national electrical codes.

This section contains important safety precautions that must be followed before attempting to install, service, or maintain electrical equipment. Carefully read and follow the safety precautions outlined below.

⚠️ DANGER

HAZARD OF ELECTRIC SHOCK, EXPLOSION, OR ARC FLASH

- Apply appropriate personal protective equipment (PPE) and follow safe electrical work practices. In the USA, see NFPA 70E or CSAZ462.
- Only qualified electrical workers should install this equipment. Such work should be performed only after reading this entire set of instructions.
- If the equipment is not used in a manner specified by the manufacturer, the protection provided by the equipment may be impaired.
- NEVER work alone.
- Before performing visual inspections, tests, or maintenance on this equipment, disconnect all sources of electric power. Assume that all circuits are live until they have been completely de-energized, tested, and tagged. Pay particular attention to the design of the power system. Consider all sources of power, including the possibility of back feeding.
- Turn off all power supplying the demand controller and the equipment in which it is installed before working on it.
- Always use a properly rated voltage sensing device to confirm that all power is off.
- Before closing all covers and doors, inspect the work area for tools and objects that may have been left inside the equipment.
- When removing or installing panels, do not allow them to extend into the energized bus.
- The successful operation of this equipment depends upon proper handling, installation, and operation. Neglecting fundamental installation requirements may lead to personal injury as well as damage to electrical equipment or other property.
- Before performing Dielectric (Hi-Pot) or Megger testing on any equipment in which the energy meter is installed, disconnect all input and output wires to the energy meter. High voltage testing may damage electronic components contained in the demand controller.
- This equipment should be installed in a suitable electrical enclosure.

Failure to follow these instructions will result in death or serious injury.

Notices

FCC PART 15 NOTICE

This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:
• Reorient or relocate the receiving antenna.
• Increase the separation between the equipment and receiver.
• Connect the equipment to an outlet on a circuit different from that to which the receiver is connected.
• Consult the dealer or an experienced radio/TV technician for help.

This Class B digital apparatus complies with Canadian ICES-003.
Chapter 3—Hardware Reference

This section supplements the meter’s installation sheet and provides additional information about the meter’s physical characteristics and capabilities.

<td>80 mS typical at 120V AC and maximum burden. 100 mS typical at 230 V AC and maximum burden 100 mS typical at 415 V AC and maximum burden</td>
</tr>
</tbody>
</table>

### DC control power

| Operating range | 125-250 V DC ±20% |
| Burden | <4 W at 250 V DC |
| Ride-through time | 50 mS typical at 125 V DC and maximum burden |

### Outputs

**Mechanical**

| Max output frequency | 0.5 Hz maximum (1 second ON / 1 second OFF - minimum times) |
| Switching current | 250 V AC at 8.0 Amps, 25 k cycles, resistive |
| | 30 V DC at 2.0 Amps, 75 k cycles, resistive  |
| | 30 V DC at 5.0 Amps, 12.5 k cycles, resistive |
| Isolation | 2.5 kV rms |

**Digital outputs**

| Max load voltage | 40 V DC |
| Max load current | 20 mA |
| On Resistance | 50 Ω max |
| Meter constant | from 1 to 9,999,999 pulses per k_h |
| Pulse width for Digital Output | 50% duty cycle |
| Pulse frequency for Digital Output | 25 Hz max. |
| Leakage current | 0.03 micro Amps |
| Isolation | 5 kV rms |
Optical outputs
- Pulse width (LED): 200 μs
- Pulse frequency: 50 Hz. max.
- Meter constant: from 1 to 9,999,999 pulses per k_h

Status Inputs
- ON Voltage: 18.5 to 36 V DC
- OFF Voltage: 0 to 4 V DC
- Input Resistance: 110 kΩ
- Maximum Frequency: 2 Hz (T ON min = T OFF min = 250 ms)
- Response Time: 20 ms
- Opto Isolation: 5 kV rms
- Wetting output: 24 V DC/ 8mA max
- Input Burden: 2 mA @ 24 V DC

Mechanical Characteristics
- Product weight: 430 g
- IP degree of protection (IEC 60529): IP52 front display, IP30 meter body
- Dimensions W x H x D [protrusion from cabinet]: 96 x 96 x 72mm (depth of meter from housing mounting flange) [13mm]
- Mounting position: Vertical
- Panel thickness: 6 mm maximum

Environmental Characteristics
- Operating temperature:
  - Meter: -25 °C to +70 °C
  - Display (Display functions to -25° with reduced performance): -25 °C to +70 °C
- Storage temp.: -40 °C to +85 °C
- Humidity range: 5 to 95 % RH at 50 °C (non-condensing)
- Pollution degree: 2
- Altitude: 2000 m CAT III / 3000 m CAT II

Electromagnetic Compatibility 3
- Electrostatic discharge: IEC 61000-4-2
- Immunity to radiated fields: IEC 61000-4-3
- Immunity to fast transients: IEC 61000-4-4
- Immunity to surge: IEC 61000-4-5
- Conducted immunity 150kHz to 80MHz: IEC 61000-4-6
- Immunity to magnetic fields: IEC 61000-4-8
- Immunity to voltage dips: IEC 61000-4-11
- Radiated emissions: FCC part 15, EN 55022 Class B
- Conducted emissions: FCC part 15, EN 55022 Class B

Safety
- Europe: CE, as per IEC 61010-1 (3rd Edition), IEC 62052-11 & IEC61557-12 1
- U.S. and Canada: cULus as per UL61010-1 (3rd Edition)
- CAN/CSA-C22.2 No. 6.1010-1 (3rd Edition)
- Measurement category (Voltage and Current inputs): CAT III up to 400 V L-N / 690 V L-L
- Dielectric: As per IEC/UL 61010-1 (3rd Edition)
- Protective Class II, Double insulated for user accessible parts

Communication
- RS-485 port Modbus RTU, Modbus ASCII (7 or 8 bit), JBUS
- 2-Wire, 9600,19200 or 38400 baud, Parity - Even, Odd, None, 1 stop bit if parity Odd or Even, 2 stop bits if None; (Optional)
- Ethernet port: 10/100 Mbps; Modbus TCP/IP 1 (Optional)
- Firmware and language file update: Meter firmware update via the communication ports
- Isolation: 2.5 kVrms, double insulated

Human Machine Interface
- Display type: Monochrome Graphics LCD
- Resolution: 128 x 128
- Backlight: White LED
- Viewable area (W x H): 67 x 62.5 mm
- Keypad: 4-button
Before you begin

Carefully read and follow the safety precautions before working with the meter.

Safety precautions

Installation, wiring, testing and service must be performed in accordance with all local and national electrical codes.

**DANGER**

HAZARD OF ELECTRIC SHOCK, EXPLOSION OR ARC FLASH

- Apply appropriate personal protective equipment (PPE) and follow safe electrical work practices. See NFPA 70E in the USA or applicable local standards.
- Turn off all power supplying this device before working on it.
- Always use a properly rated voltage sensing device to confirm that all power is off.
- Do not exceed the device’s ratings for maximum limits.
- Always use grounded external CTs for current inputs.

Failure to follow these instructions will result in death or serious injury.

1. Turn off all power supplying this device before working on it.
2. Always use a properly rated voltage sensing device to confirm that all power is off.

Dimension

Figure 3–1: Dimension
Meter mounting

This section describes how to mount the meter.

Mounting the PM5300

The meter is designed to be mounted inside a 1/4-DIN panel cutout.

1. Inspect the gasket (installed around the perimeter of the front display) and make sure it is secured properly and not damaged.

2. Insert the meter through the mounting hole.

3. Line up the tabs of the retainer clips with the slots on either side of the meter. While holding the retainers at a slight angle, push the retainers in and forward to position them in place. In situations where the spacing between meters is tight, use a flat-head screwdriver with a long, narrow shaft to help secure the clips.
4. Push the middle of the clip assembly to lock the retainer in place and secure the meter.

Meter wiring

For wiring instructions and safety precautions, see the meter installation sheet that was shipped with your meter, or download a copy at www.schneider-electric.com.

- Wire connections to the meter’s voltage inputs, control power, digital outputs, digital (status) inputs and RS-485 communications are terminated using the supplied pluggable wire connectors.
- When wiring the meter’s current inputs, terminate the wire ends with ring or split-ring crimp connectors.

Use the meter installation sheet when wiring the meter.

**NOTE:** According to Blondel's theorem, in an N wire system a minimum of N-1 measuring elements are required for correct measurement.
NOTE:

- Clearly label the device’s disconnect circuit mechanism and install it within easy reach of the operator.
- The fuses / circuit breakers must be rated for the installation voltage and sized for the available fault current.
- Fuse for neutral terminal is required if the source neutral connection is not grounded.

Power system

This section outlines typical requirements for wiring the voltage and current inputs of the meter to the electrical power system.

For wiring instructions and safety precautions, see the meter installation sheet that was shipped with your meter, or download a copy at www.schneider-electric.com.

Direct connect voltage limits

You can connect the meter’s voltage inputs directly to the phase voltage lines of the power system if the power system’s line-to-line or line-to-neutral voltages do not exceed the meter’s direct connect maximum voltage limits. The meter's voltage measurement inputs are rated by the manufacturer for up to 400 V L-N / 690 V L-L. However, the maximum voltage allowed for direct connection may be lower, depending on the local electrical codes and regulations. In US and Canada the maximum voltage on the meter voltage measurement inputs may not exceed 347 V L-N / 600 V L-L.

If your system voltage is greater than the specified direct connect maximum voltage, you must use VTs (voltage transformers) to step down the voltages.
## Power system setup parameters

</tr>
</tbody>
</table>
## Voltage and current input wiring

For wiring instructions and safety precautions, see the meter installation sheet that was shipped with your meter, or download a copy at www.schneider-electric.com.

### Voltage input protection

The meter’s voltage inputs must be wired to fuses/breakers and a disconnect switch. If using a voltage transformer (VT), both primary and secondary sides of the VT must be wired to fuses/breakers and disconnect switches.

- Clearly label the device’s disconnect circuit mechanism and install it within easy reach of the operator.
- The fuses / circuit breakers must be rated for the installation voltage and sized for the available fault current.
- Fuse for neutral terminal is required if the source neutral connection is not grounded.

See the meter installation sheet for fuse ratings.

### Current input protection

For all connected current inputs, use a CT shorting block to short-circuit the secondary leads of the CTs before removing the current input connections to the meter.

**NOTE:** Ground any unused current inputs.

</tbody>
</table>
Balanced system considerations

In situations where you are monitoring a balanced 3-phase load, you may choose to connect only one or two CTs on the phase(s) you want to measure, and then configure the meter so it calculates the current on the unconnected current input(s).

**NOTE:** For a balanced 4-wire Wye system, the meter’s calculations assume that there is no current flowing through the neutral conductor.

**Balanced 3-phase Wye system with 2 CTs**

The current for the unconnected current input is calculated so that the vector sum for all three phase currents equal zero.

**Balanced 3-phase Wye or Delta system with 1 CT**

The currents for the unconnected current inputs are calculated so that their magnitude and phase angle are identical and equally distributed, and the vector sum for all three phase currents equal zero.

**NOTE:** You must always use 3 CTs for 3-phase 4-wire center-tapped Delta or center-tapped open Delta systems.

Control power wiring

For wiring instructions and safety precautions, see the meter installation sheet that was shipped with your meter, or download a copy at www.schneider-electric.com.

The meter can be powered from an AC or DC power source.

- L1 and L2 are non-polarized. If using an AC power supply with neutral, connect neutral to the meter’s L2 terminal.
- Always use a fuse on L1. Fuse L2 when connecting an ungrounded neutral to the control power.
- If using a control power transformer, fuse both primary and secondary sides of the transformer.
- The fuses / circuit breakers must be rated for the installation voltage and sized for the available fault current.

Communications

This section provides additional information about the communications ports and topologies supported by the meter. You must wire and configure the RS-485 port or the Ethernet port in order to communicate with the meter.

Serial communications

The meter supports serial communications through the RS-485 port. Up to 32 devices can be connected on a single RS-485 bus.

In an RS-485 network, there is one master device, typically an Ethernet to RS-485 gateway. It provides the means for RS-485 communications with multiple slave devices (for example, meters). For applications that require only one dedicated computer to communicate with the slave devices, an RS-232 to RS-485 converter can be used as the master device.
RS-485 wiring

Connect the devices on the RS-485 bus in a point-to-point configuration, with the (+) and (-) terminals from one device connected to the corresponding (+) and (-) terminals on the next device.

RS-485 cable

Use a shielded 1.5 twisted pair or 2 twisted pair RS-485 cable to wire the devices. Use one twisted pair to connect the (+) and (-) terminals, and use the other insulated wire to connect the C terminals.

RS-485 terminals

<table>
<thead>
<tr>
<th>Terminal</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>C</td>
<td>Common. This provides the voltage reference (zero volts) for the data plus and data minus signals.</td>
</tr>
<tr>
<td>☛</td>
<td>Shield. Connect the bare wire to this terminal to help suppress signal noise that may be present. Ground the shield wiring at one end only (either at the master or the last slave device, but not both).</td>
</tr>
<tr>
<td>-</td>
<td>Data minus. This transmits/receives the inverting data signals.</td>
</tr>
<tr>
<td>+</td>
<td>Data plus. This transmits/receives the non-inverting data signal.</td>
</tr>
</tbody>
</table>

RS-485 maximum cable length

The total distance for devices connected on an RS-485 bus should not exceed 1200 m (4000 ft).

RS-485 recommended topologies

Use the straight-line or loop topology when connecting your devices on the RS-485 bus.
To reduce signal reflections on the RS-485 network when using the straight-line wiring method, connect a terminating resistor ($R_T$) across the (+) and (-) terminal of the last device on the bus. The terminating resistor should match the impedance of the RS-485 cable, typically 120 ohms.

There are a couple of advantages to using the loop topology:

- A single open-circuit condition anywhere on the loop does not result in communications loss for all the other connected devices on the RS-485 bus.
- It does not require termination resistors at any point on the RS-485 bus.

**RS-485 topologies to avoid**

Do not use the star, tee (T) or any other wiring methods that cause a branch in the main RS-485 bus. These cause signal reflections which may result in interference.
The PowerLogic™ EGX series Ethernet gateway allows you to connect multiple devices using RS-485. See the applicable EGX documentation for details on adding devices to the EGX.

**RS-485 network configuration**

After you have wired the RS-485 port and powered up the meter, you must configure the serial communications port in order to communicate with the meter.

Each device on the same RS-485 communications bus must have a unique address and all connected devices must be set to the same protocol, baud rate, and parity (data format).

**NOTE:** To communicate with the meter using ION Setup, you must set the parity to “None” for all devices in the RS-485 network.

For meters that do not have a display, you must first wire and configure each one separately before connecting these meters to the same RS-485 bus.
Related topics

- To configure RS-485 communications, see “Setting up serial communications” on page 34.

Ethernet communications

The meter uses Modbus TCP protocol to communicate at data speeds up to 100 Mbps through its Ethernet communications port.

Use a Cat 5 cable to connect the meter’s Ethernet port. Your Ethernet connection source should be installed in a location that minimizes the overall Ethernet cable routing length.

Ethernet configuration

To communicate with the meter through Ethernet, all devices must have a unique IP address and be set to the same subnet mask and gateway.

- To configure Ethernet communications, see “Setting up Ethernet communications” on page 35.

Digital outputs

The meter is equipped with two digital output ports (D1, D2). You can configure the digital outputs for use in the following applications:

- switching applications, for example, to provide on/off control signals for switching capacitor banks, generators, and other external devices and equipment
- demand synchronization applications, where the meter provides pulse signals to the input of another meter to control its demand period
- energy pulsing applications, where a receiving device determines energy usage by counting the k_h pulses coming from the meter’s digital output port

The digital outputs can handle voltages less than 40 V DC. For higher voltage applications, use an external relay in the switching circuit.
Related topics

- See “Digital output applications” on page 50 for digital output use and configuration details.

Status inputs

The meter is equipped with two status input ports (S1 and S2). You can configure the status inputs for use in status monitoring applications.

The meter’s status inputs require an external voltage source to detect the status input’s on/off state. The meter detects an ON state if the external voltage appearing at the status input is within its operating range.

The external voltage can be derived from either the whetting output provided by the meter or by a voltage source up to 36 V DC external to the meter.

Status input connections

Relay outputs

The meter is equipped with two Form A mechanical relay output ports (Relay 1 and Relay 2). Relay outputs can be configured to be used switching applications, for example, to provide on/off control signals for switching capacitor banks, generators, and other external devices and equipment.
Relay output connections

* The overcurrent protective device must be rated for the short-circuit current at the connection point.
Chapter 4—Front panel display and meter setup

The front panel display lets you use the meter to perform various tasks such as setting up the meter, displaying data screens, acknowledging alarms, or performing resets.

Parts of the display

</tbody>
</table>

LED indicators

The meter has two LED indicators on the front panel.

Front panel LEDs

Heartbeat / communications LED

The (green) heartbeat / communications LED blinks at a slow, steady rate to indicate the meter is operational. The LED flashes at a variable, faster rate when the meter is communicating over a Modbus serial communications port.

You cannot configure this LED for other purposes.

NOTE: A heartbeat LED that remains lit and does not blink (or flash) indicates a possible hardware problem. Please contact Technical Support.

Alarm / energy pulsing LED modes

The (orange) alarm / energy pulsing LED can be configured for alarm notification or energy pulsing.

- When configured for alarm notification, this LED flashes when a high, medium or low priority alarm is active. This provides a visual indication of an active alarm condition, or an inactive but unacknowledged high priority alarm.
- When configured for energy pulsing, this LED flashes at a rate proportional to the amount of energy consumed. This is typically used to verify the meter’s accuracy.
Related topics

- See “Setting up the alarm / energy pulsing LED” on page 40 for details on using the front panel to switch the LED mode for alarming or energy pulsing applications.
- See “Alarm / energy pulsing LED setup” on page 58 for details on using ION Setup to switch the LED mode for alarming or energy pulsing applications.
- See “Alarm Priorities” on page 64 for a detailed description on the alarm / energy pulsing LED’s behavior when it is configured for alarm notification.

Notification icons

To alert you about meter state or events, notification icons appear at the top left or top right corner of the display screen.

<table>

Menu tree

This summarizes the meter screens (IEEE menus shown, with the corresponding IEC menus in parentheses — see “Setting up regional settings” on page 37).

PM5300 display screen menus
Meter setup screen navigation

The meter’s front panel buttons and display screen allow you to navigate and configure the meter’s setup parameters. The following illustration shows one of the meter setup screens.

Basic setup screen

In this example, the down arrow (▼) indicates there are more parameters below the selected option (►). Press the down arrow button to display additional parameters. The down arrow disappears when the last item in the list is selected, and there are no more parameters to display.

Front panel meter setup

Meter configuration can be performed directly through the front panel buttons or remotely through software. This section contains instructions on setting up the meter using the front panel.

Related topics

• See “Remote Meter Setup” on page 42 for remote meter setup details.

Configuring the basic setup parameters

Proper configuration of the meter’s basic setup parameters is essential for accurate measurement and calculations. Use the Basic Setup screen to define the electrical power system that the meter is monitoring.

NOTICE

UNINTENDED EQUIPMENT OPERATION

After modifying any basic setup parameter:

• Verify all standard alarms settings are correct and make adjustments as necessary.
• Re-enable all configured alarms.

Failure to follow these instructions can result in incorrect alarm functions.

If standard (1-sec) alarms have been configured and you make subsequent changes to the meter’s basic setup, all alarms are disabled to prevent undesired alarm operation. After saving the changes, confirm all configured standard alarm settings are still valid, reconfigure them as required, and re-enable the alarms.
1. Navigate to **Maint > Setup**.
2. Enter the setup password (default is “0000”), then press **OK**.
3. Navigate to **Meter > Basic**.
4. Move the cursor to point to the parameter you want to modify, then press **Edit**.
5. Modify the parameter as required, then press **OK**.
6. Move the cursor to point to the next parameter you want to modify, press **Edit**, make your changes, then press **OK**.

### Basic setup menu tree

```
Maint    Reset    Meter    Basic
       Setup    Comm
```

7. Press ▲ to exit. Press **Yes** to save your changes.

</tbody>
</table>

Setting up serial communications

The Serial Port setup screen allows you to configure the meter’s RS-485 communications port so you can use software to access the meter’s data or configure the meter remotely.

Serial communications setup menu tree

1. Navigate to **Maint > Setup**.
2. Enter the setup password (default is “0000”), then press **OK**.
3. Press **Comm**.
4. Move the cursor to point to the parameter you want to modify, then press **Edit**.
5. Modify the parameter as required, then press **OK**.
6. Move the cursor to point to the next parameter you want to modify, press **Edit**, make your changes, then press **OK**.
Setting up Ethernet communications

The Ethernet Port setup screen allows you to assign the meter a unique IP address so you can use software to access the meter’s data or configure the meter remotely through the Ethernet port. Before configuring the Ethernet parameters, make sure you obtain your meter’s IP address information from your network administrator or IT department.

Ethernet communications setup menu tree

1. Navigate to **Maint > Setup**.
2. Enter the setup password (default is “0000”), then press **OK**.
3. Press **Comm**.
4. Move the cursor to point to the parameter you want to modify, then press **Edit**.
5. Modify the parameter as required, then press **OK**.
6. Move the cursor to point to the next parameter you want to modify, press **Edit**, make your changes, then press **OK**.

Chapter 4—Front panel display and meter setup

### HMI settings

The HMI (human-machine interface) setup screens allow you to:

- control the general appearance and behavior of the display screens,
- change the regional settings, or
- change the meter passwords.

### Setting up the display

You can change the display screen’s contrast or the screen backlight and timeout settings.

#### Display setup menu tree

1. Navigate to **Maint > Setup**.
2. Enter the setup password (default is "0000"), then press **OK**.
3. Navigate to **HMI > Displ**.
4. Move the cursor to point to the parameter you want to modify, then press **Edit**.
5. Modify the parameter as required, then press **OK**.
6. Move the cursor to point to the next parameter you want to modify, press **Edit**, make your changes, then press **OK**.

---

### Ethernet port settings

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Values</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP Address</td>
<td>Contact your local network administrator for parameter values.</td>
<td>The internet protocol address of your device.</td>
</tr>
<tr>
<td>Subnet</td>
<td>The Ethernet IP subnetwork address of your network (subnet mask).</td>
<td>The Ethernet IP subnetwork address of your network.</td>
</tr>
<tr>
<td>Gateway</td>
<td>The Ethernet IP gateway address of your network.</td>
<td></td>
</tr>
<tr>

<tr>
<td></td>
<td>• Stored: Use the static value programmed in the IP Address setup register</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Default: Use 85.16 as the first two values of the IP address, then convert the last two hexadecimal values of the MAC address to decimal and use this as the last two values of the IP address. Example: MAC address = 00:80:67:82:B8:C8 Default IP = 85.16.184.200</td>
<td></td>
</tr>
</tbody>
</table>

7. Press ▲ to exit. Press Yes to save your changes.
Setting up regional settings

You can change the regional settings to localize the meter screens and display data in a different language, using local standards and conventions.

**NOTE:** In order to display a different language other than those listed in the **Language** setup parameter, you need to download the appropriate language file to the meter using the appropriate firmware upgrade tool such as DLF3000. See “Downloading Firmware” on page 104.

### Regional settings menu tree

![Regional settings menu tree](image)

1. Navigate to **Maint > Setup**.
2. Enter the setup password (default is “0000”), then press **OK**.
3. Navigate to **HMI > Region**.
4. Move the cursor to point to the parameter you want to modify, then click **Edit**.
5. Modify the parameter as required, then press **OK**.
6. Move the cursor to point to the next parameter you want to modify, press **Edit**, make your changes, then press **OK**.

### Regional settings setup parameters

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

7. Press ▲ to exit. Press **Yes** to save your changes.

### Setting up the screen passwords

This can only be configured through the front panel. The factory-default setting for all passwords is “0000”. Changing the default password for screens that are password-
protected prevents unauthorized personnel from accessing certain screens such as the diagnostics and reset screens.

**NOTICE**

**LOST DATA**
Record your meter’s screen password information in a secure location.

**Failure to follow these instructions can result in data loss.**

If you lose your password, you must return the meter for factory reconfiguration, which resets your device to its factory defaults and destroys all logged data.

**Password setup menu tree**

1. Navigate to **Maint > Setup**.
2. Enter the setup password (default is “0000”), then press **OK**.
3. Navigate to **HMI > Pass**.
4. Move the cursor to point to the parameter you want to modify, then press **Edit**.
5. Modify the parameter as required, then press **OK**.
6. Move the cursor to point to the next parameter you want to modify, press **Edit**, make your changes, then press **OK**.

**Password setup parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Values</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Setup</td>
<td>0000 - 9999</td>

</tr>
<tr>
<td>Diagnostics</td>
<td>0000 - 9999</td>
<td>Sets the password for accessing the meter’s diagnostics screens.</td>
</tr>
</tbody>
</table>

7. Press ▲ to exit. Press Yes to save your changes.

**Lost password**

If you lose your password, contact technical support for instructions on how to return your meter for factory reconfiguration.

- Global-PMC-Tech-support@schneider-electric.com
- (00) + 1 (250) 544-3010

**NOTE:** Be sure to include your meter’s serial number in your e-mail or have it readily available when calling technical support.
Setting the clock

The Clock setup screens allow you to set the meter’s date and time.

Clock setup menu tree

1. Navigate to **Maint > Setup**.
2. Enter the setup password (default is “0000”), then press **OK**.
3. Navigate to **Clock**.
4. Move the cursor to point to the parameter you want to modify, then press **Edit**.
5. Modify the parameter as required, then press **OK**.
6. Move the cursor to point to the next parameter you want to modify, press **Edit**, make your changes, then press **OK**.

Clock setup parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Format</th>

</tr>
<tr>
<td>GMT Offset (h)</td>
<td>-</td>
<td>Set the GMT Offset between ± 00.0 and ± 12.0 hrs.</td>
</tr>
</tbody>
</table>

7. Press ▲ to exit. Press **Yes** to save your changes.

Related topics

- See “Setting up regional settings” on page 37 for instructions on changing the format of the displayed date and time.

Advanced setup

The advanced setup screens let you change the meter name, set up a timer for monitoring load current, and specify the minimum demand current for total demand distortion calculations.

- Load Timer Setpt: specifies the minimum current at the load before the timer starts.
- Pk I dmd for TDD: specifies the minimum current demand value to consider for total demand distortion calculations.

Advanced setup menu tree

1. Navigate to **Maint > Setup**.
2. Enter the setup password (default is “0000”), then press **OK**.
Chapter 4—Front panel display and meter setup

3. Navigate to **Meter > Advan**.
4. Move the cursor to point to the parameter you want to modify, then press **Edit**.
5. Modify the parameter as required, then press **OK**.
6. Move the cursor to point to the next parameter you want to modify, press **Edit**, make your changes, then press **OK**.

**Advanced setup parameters**

<table>

<tr>
<td>Label</td>
<td>-----</td>
<td>This label identifies the device, e.g., “Power Meter”. You cannot use the front panel to edit this parameter. Use ION Setup to change the device label.</td>
</tr>
<tr>
<td>Load Timer Setpt (A)</td>
<td>0 - 99999</td>
<td>Specifies the minimum average current at the load before the timer starts. The meter begins counting the operating time whenever the readings are equal to or above this average current threshold.</td>
</tr>
<tr>
<td>Pk I dmd for TDD (A)</td>
<td>0 - 99999</td>
<td>Specifies the minimum peak current demand at the load for inclusion in total demand distortion (TDD) calculations. If the load current is below the minimum peak current demand threshold, the meter does not use the readings to calculate TDD. Set this to “0” (zero) if you want the power meter to use the metered peak current demand for this calculation.</td>
</tr>
</tbody>
</table>

7. Press **Yes** to save your changes.

**Related topics**

- See “Total Harmonic Distortion and Total Demand Distortion” on page 89 for details on how the meter calculates TDD.

**Setting up the alarm / energy pulsing LED**

The LED setup screen allows you to configure the alarm / energy pulsing LED for alarming or energy pulsing application.

**Alarm / energy pulsing LED settings menu tree**

1. Navigate to **Maint > Setup**.
2. Enter the setup password (default is “0000”), then press **OK**.
3. Navigate to **I/O > LED**.
4. Press **Edit**.
5. Press ↑ or ↓ to modify the parameter as required, then press **OK**.

**LED setup parameter**

<table>
<thead>
<tr>

</thead>
<tbody>
<tr>
<td>Mode</td>
<td>Off, Alarm, Energy</td>
<td>Off disables the LED. Alarm sets the LED for alarm notification. Energy sets the LED for energy pulsing.</td>
</tr>
</tbody>
</table>

6. Press ▲ to exit. Press **Yes** to save your changes.
Related topics

- See “Setting up the alarm / energy pulsing LED” on page 40 for details on setting up the LED for alarms.

Input / output setup

The meter’s input/output (I/O) ports extend the capabilities of the meter. The I/O ports can be configured using the front panel or ION Setup.

Related topics

- See “Input / Output” on page 47 for a comprehensive description and setup instructions using the front panel.
- See “Technical Specifications” on page 11 for electrical characteristics and limits of meter’s I/O ports.

Demand setup

Demand is a measure of average consumption over a fixed time interval.

Use the Demand setup screens to define power demand, current demand or input metering demand.

Demand setup menu tree

1. Navigate to Maint > Setup.
2. Enter the setup password (default is “0000”), then press OK.
3. Navigate to Meter > Dmd.
4. Move the cursor to select Power Demand or Current Demand.
5. Move the cursor to point to the parameter you want to modify, then press Edit.
6. Modify the parameter as required, then press OK.
7. Move the cursor to point to the next parameter you want to modify, press Edit, make your changes, then press OK.

Power or current demand setup parameters

8. Press **Yes** to save your changes.

## Multi-tariff setup

The meter’s multi-tariff feature allows you to use up to 4 different tariff “containers” to store accumulated energy data. The Tariff setup screens allow you to configure how and when to apply the different tariffs.

### Related topics

- See “Configuring tariffs using the front panel” on page 85 for a comprehensive description and setup instructions using the front panel.

## Alarms setup

An alarm is the meter’s means of notifying you when an alarm condition is detected, such as an error or event that falls outside of normal operating conditions.

### Related topics

- See “Alarms” on page 61 for a comprehensive description and detailed setup instructions.

## Remote Meter Setup

You can use ION Setup to remotely access the meter.

For more information on the ION setup configuration, please refer to *ION Setup 3.0 Device configuration guide*.
Chapter 5—Viewing Meter Data

You can view meter data from the meter’s front panel display, a web browser, or through software.

Viewing meter data from the front panel

The Summary screen displays real-time values for average voltage and current (Vavg, Iavg), total power (Ptot) and energy consumption (E Del).

Summary screen

Displaying data screens

To display data screens, press the button below the appropriate menu. To see more menu items, press the navigation button.

Related topics
• See “Front panel display and meter setup” on page 29 for information on front panel menu navigation.

Meter data display screens

The screen menu items are listed below. The titles listed are for the HMI mode in IEEE, with the corresponding titles in IEC mode in square brackets [ ].

<td>2 (D1+, D2+)</td>
<td>2 (Relay 1, Relay 2)</td>
</tr>
</tbody>
</table>

NOTE: Relay = Form A relay

After you wire the meter’s I/O ports, you can configure these ports so you can use the meter to perform I/O functions.

Status input applications

Status inputs are typically used for monitoring the status of external contacts or circuit breakers.

The meter’s status inputs require either an external voltage source or whetting voltage (provided in the meter) to detect the status input’s ON/OFF state. The meter detects an ON state if the external voltage appearing at the status input is within its operating range.

DANGER

HAZARD OF ELECTRIC SHOCK, EXPLOSION, OR ARC FLASH

- Apply appropriate personal protective equipment (PPE) and follow safe electrical work practices. See NFPA 70E in the USA or applicable local standards.
- Turn off all power supplying this device before working on it.
- Always use a properly rated voltage sensing device to confirm that all power is off.
- Do not exceed the device’s ratings for maximum limits.
- Do not use this device for critical control or protection applications where human or equipment safety relies on the operation of the control circuit.

Failure to follow these instructions will result in death or serious injury.

Wiring the status inputs
Related topics

- See “Technical Specifications” on page 11 for electrical characteristics and limits for the status inputs.

Status input setup

The status input ports (S1 and S2) can be configured using the front panel or ION Setup software.

**NOTE:** It is recommended you use ION Setup to configure the status inputs, as setup parameters that require text entry can only be modified using ION Setup.

Configuring status inputs using ION Setup

You can use ION Setup to configure the status inputs.

1. Start ION Setup.
2. Connect to your meter.
3. Navigate to I/O configuration > I/O Setup.
4. Select a status input to configure and click **Edit**. The setup screen for that status input is displayed.
5. Enter a descriptive name for the status input’s **Label**.
6. Configure the other setup parameters as required.
7. Click **Send** to save your changes.

**Status input setup parameters available through ION Setup**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Values</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>—</td>
<td>Use this field to change the default label and assign a descriptive name to this status input.</td>
</tr>
</tbody>
</table>
| Control Mode  | Normal, Demand Sync, Input Metering | This field displays how the status input functions.                                                                                                         
|               |                              | • Normal: the status input is not associated with another meter function. The meter counts and records the number of incoming pulses normally.                                                         |
|               |                              | • Demand Sync: the status input is associated with one of the input sync demand functions. The meter uses the incoming pulse to synchronize its demand period with the external source. |
|               |                              | • Input Metering: the status input is associated with one of the input metering channels. The meter counts and records the number of incoming pulses and related consumption data associated with the pulses. |
| Debounce      | 0 to 9999                    | Debounce is the time delay that compensates for mechanical contact bounce. Use this field to set how long (in milliseconds) the external signal must remain in a certain state to be considered a valid state change. |
| Associations  | —                            | This field displays additional information if the status input is already associated with another meter function.                                                                                           |
Configuring status inputs using the front panel

You can use the front panel to configure the status inputs.

Status input setup menu tree

1. Navigate to Maint > Setup.
2. Enter the setup password (default is “0”), then press OK.
3. Navigate to I/O > S In.
4. Move the cursor to point to the status input you want to set up, then press Edit.
5. Move the cursor to point to the parameter you want to modify, then press Edit.
   **NOTE:** If Edit is not displayed, it means the parameter is either read-only or can only be modified through software.
6. Modify the parameter as required, then press OK.
7. Move the cursor to point to the next parameter you want to modify, press Edit, make your changes, then press OK.
8. Press ▲ to exit. Press Yes to save your changes.

**Related topics**

See “Technical Specifications” on page 11 for electrical characteristics and limits for the status inputs.
Digital output applications

Digital outputs are typically used in switching applications, for example, to provide on/off control signals for switching capacitor banks, generators, and other external devices and equipment. They can also be used in demand synchronization applications, where the meter provides pulse signals to the input of another meter to control its demand period.

The digital output can also be used in energy pulsing applications, where a receiving device determines energy usage by counting the kWh pulses coming from the meter’s digital output port.

**DANGER**

HAZARD OF ELECTRIC SHOCK, EXPLOSION, OR ARC FLASH

- Apply appropriate personal protective equipment (PPE) and follow safe electrical work practices. See NFPA 70E in the USA or applicable local standards.
- Turn off all power supplying this device before working on it.
- Always use a properly rated voltage sensing device to confirm that all power is off.
- Do not exceed the device’s ratings for maximum limits.
- Do not use this device for critical control or protection applications where human or equipment safety relies on the operation of the control circuit.

Failure to follow these instructions will result in death or serious injury.

**NOTE:** Be aware that an unexpected change of state of the digital outputs may result when the supply power to the meter is interrupted or after a meter firmware upgrade.

Digital output application example

You can connect your meter’s digital outputs to other meters to send a demand sync pulse. In the following example, the first meter (Meter 1) controls and sets the demand period of the other meters (Meter 2, Meter 3, Meter 4) through the output pulse occurring at the end of the first meter’s demand interval.

Digital output wiring example

![Diagram showing digital output wiring example](image)

**Related topics**

- See “Technical Specifications” on page 11 for electrical characteristics and limits for the digital outputs.

Digital output setup

The digital output ports (D1 and D2) can be configured using the front panel or ION Setup.

**NOTE:** It is recommended you use ION Setup to configure the digital outputs, as setup parameters that require text entry can only be modified using software.
Configuring digital outputs using ION Setup

You can use ION Setup to configure the digital outputs (D1 and D2).

1. Start ION Setup.
2. Connect to your meter
3. Navigate to I/O configuration > I/O Setup.
4. Select a digital output to configure and click Edit. The setup screen for that digital output is displayed.
5. Enter a descriptive name for the digital output’s Label.
6. Configure the other setup parameters as required.
7. Click Send to save your changes.

| Associations       | —                       | This field displays additional information if the relay output is already associated with another meter function. |
Configuring relay outputs using the front panel

You can use the front panel to configure the relay outputs.

Relay output setup menu tree

1. Navigate to **Maint > Setup**.
2. Enter the setup password (default is “0”), then press **OK**.
3. Navigate to **I/O > Relay**.
4. Move the cursor to point to the relay output you want to set up, then press **Edit**.
5. Move the cursor to point to the parameter you want to modify, then press **Edit**.

**NOTE:** If **Edit** is not displayed, it means the parameter is either read-only or can only be modified through software.

6. Modify the parameter as required, then press **OK**.
7. Move the cursor to point to the next parameter you want to modify, press **Edit**, make your changes, then press **OK**.
8. Press **▲** to exit. Press **Yes** to save your changes.

Relay output setup parameters available through the front panel

Alarm / energy pulsing LED setup

The meter’s LED can be configured for alarm indication or energy pulsing.

When set to detect alarms, the LED blinks to indicate an alarm condition. See “Alarm Priorities” on page 64 for a description of the LED behavior based on different alarms.

When the LED is set to energy pulsing, the meter sends a readable pulse or signal based on the measured energy. This pulse can be used for accuracy verification or as an input to another energy monitoring system. The meter uses the pulse constant setting (in pulses per k_h) to determine the frequency and number of pulses sent to the LED.

The LED setup screen allows you to configure the alarm / energy pulsing LED for alarming or energy pulsing applications.
Configuring the LED or digital output for energy pulsing using ION Setup

You can use the ION Setup to configure your meter’s LED or digital output for energy pulsing.

1. Start ION Setup.
2. Connect to your meter
4. Select the LED or a digital output to configure and click Edit. The setup screen is displayed.
5. Enter a descriptive name for the digital output’s Label.
6. Configure the other setup parameters as required.
7. Click Send to save your changes.

6. Press ▲ to exit. Press **Yes** to save your changes.
Chapter 7—Alarms

This section describes the alarm features on PM5300 series Power and Energy meters.

About Alarms

The \( \Delta \) icon appears in the upper-right corner of the meter display when an alarm is active.

If the energy/alarm LED has been configured for alarms, the energy/alarm LED flashes when an alarm is active. See “Alarm / energy pulsing LED setup” on page 58 for more information.

The power meter maintains a counter for each alarm to help keep track of the total number of occurrences (see Figure 7–1).

Figure 7–1: Alarm Counters

If you make changes to the basic power meter setup, all alarms are disabled to prevent undesired alarm operation. Confirm alarm configuration and enable required alarms.

**NOTE:** Only alarms that apply to the selected power system configuration can be enabled.

The available alarms for this power meter are described in the following sections.

1-Second Alarms

The power meter has 29 standard 1-second over/under alarms. See Table 7–1 for a complete list.

Use the display to configure 1-second alarms with the following values:

- Enable—disable (default) or enable
- Pickup Setpoint (magnitude)
- Pickup Time Delay (in seconds)
- Dropout Setpoint (magnitude)
- Dropout Time Delay (in seconds)

</tbody>
</table>
Many of the 1-second alarms are three-phase alarms. Alarm setpoints are evaluated for each of the three phases individually, but the alarm is reported as a single alarm. The alarm pickup occurs when the first phase exceeds the alarm pickup magnitude for the pickup time delay. The alarm is active as long as any phase remains in an alarm state. The alarm dropout occurs when the last phase drops below the dropout magnitude for the dropout time delay. See Figure 7–2 below.

**Figure 7–2: How the power meter handles setpoint-driven alarms**

- **EV1**—The power meter records the date and time that the pickup setpoint and time delay were satisfied, and the maximum value reached (Max1) during the pickup delay period (ΔT). Also, the power meter performs any tasks assigned to the event such as operation of a digital output.

- **EV2**—The power meter records the date and time that the dropout setpoint and time delay were satisfied, and the maximum value reached (Max2) during the alarm period.

### Digital Alarms

The power meter has two digital alarms for alarming on status input status. By default, the digital alarms are active when the associated status input is ON. The pickup and dropout time delays are configured in seconds.
Unary Alarms

The power meter has four unary alarms. These alarms help to alert you when the meter powers on after a control power loss, when the meter resets for any reason, when the meter self-diagnostic feature detects a problem, or when the meter detects a phase rotation different than expected.

Alarm Priorities

Each alarm has a priority level. Use priorities to help distinguish between events that require immediate action and those that do not require action. See “Setting up the alarm / energy pulsing LED” on page 40 for information on configuring the alarm LED for alarm mode.

- **High priority**—if a high priority alarm occurs, the display informs you in two ways: the alarm LED on the display flashes until you acknowledge the alarm, and the alarm icon blinks while the alarm is active. An alarm message is displayed while the alarm is active. See “Viewing Unacknowledged Alarms and the Alarm History Log” on page 71 for information on acknowledging alarms.
- **Medium priority**—if a medium priority alarm occurs, the alarm LED and the alarm icon blink only while the alarm is active. An alarm message is displayed while the alarm is active.
- **Low priority**—if a low priority alarm occurs, the alarm LED and the alarm icon blink only while the alarm is active. No alarm message is displayed.
- **No priority**—if an alarm is set up with no priority, no visible representation appears on the display. Alarms with no priority are not entered in the alarm Log.

If multiple alarms with different priorities are active at the same time, the display shows the alarms in the order they occurred.

When a pickup event occurs, the active alarm list appears. Press “Detail” to see more event information. See “Alarm Setup” on page 64 for more information.

Using an Alarm to Control a Relay and Digital Output

Relays can be configured as external, and alarm. Digital Outputs can be configured as external, demand sync, and alarm. See the “Setting Up Alarms” sections in this chapter and “Digital output setup” on page 50.

Alarm Setup

Evaluation of all alarms is temporarily suspended while alarm setup screens are displayed. Evaluation resumes immediately upon exit from alarm setup screens.

To set up standard alarms:

1. Navigate to Maint > Setup.
2. Enter the setup password (default is “0000”), then press OK.
3. Press Alarm.

Use the directions in the following sections to set up alarms.
Setting Up 1-Second Alarms

To set up a standard alarm:

1. Press 1- Sec. The 1-second alarm Select screen appears.
2. Press ▼ and ▲ to scroll through the list of standard 1-second alarms.
3. Press Edit to select an alarm to be configured.
4. Press Edit to select Pickup Setpoint.
5. Press + to increment the active digit through the numerals 0-9.
6. Press ◀ to enter the selected value for the active digit and move to the next digit to the left.
7. Continue until all values are selected, then press OK to enter the selected number for the pickup setpoint.
8. For power factor alarms (Lead PF, True; Lag PF, True; Lead PF, Disp; and Lag PF, Disp) press ▼ to select PU Set Point Lead/Lag, then press Edit. For other alarms, skip to Step 11.
9. Press + and - to scroll between Lead and Lag.
10. Press OK to set the pickup set point lead or lag.
11. Press ▼ and follow Steps 4 to 7 for Pickup Time Delay and Dropout Setpoint.
12. For power factor alarms, press ▼ to select DO Set Point Lead/Lag and follow Steps 10 and 11. For other alarms, proceed to Step 14.
13. Press ▼ and follow Steps 4 to 7 for Dropout Time Delay.
14. Press ▼ to select Enable, then press Edit.
15. Press + and - to scroll between Yes and No.
16. Press OK to enable or disable the alarm.
Setting Up 1-Second Alarms (continued)

17. Press ▼ to select Priority, then press Edit.

18. Press + and - to scroll through priority options None, High, Medium, or Low.
   NOTE: See “Alarm Priorities” on page 64 for more information.

19. Press OK to set the priority.

20. Press ▼ to select Select Digital Output, then press Edit.

21. Press + and - to scroll through the list of digital outputs to associate with the alarm.

22. Press OK to select a digital output to be associated with the selected alarm.

23. If the selected digital output already has an association that will be lost by making the new selection, a confirmation screen appears.
   — Press Yes to accept the changes and return to the previous screen.
   — Press No to keep the existing configuration in use and return to the previous screen.

24. Press ▲ to save all alarm selections and return to the previous screen.

25. Press ▲ to save all 1-second alarm selections.

NOTE: The Over Demand alarms are applicable for systems in which the energy is delivered to the customer only.
Setting Up Unary Alarms

To set up unary alarms:

1. Press **Unary**. The unary alarm Select screen appears.
2. Press ▼ and ▲ to scroll through the list of unary alarms.
3. Press **Edit** to select an alarm to be configured.
4. Press **Edit** to select Enable.
5. Press + and - to scroll between Yes and No.
6. Press **OK** to enable or disable the alarm.
7. Press ▼ to select Priority.
8. Press + and - to scroll through priority options Low, None, High, or Medium.
   **NOTE:** See “Alarm Priorities” on page 64 for more information.
9. Press **OK** to set the priority.
10. Press ▼ to select Select Digital Output, then press **Edit**.
    **NOTE:** The digital output behavior mode must be Timed or Coil Hold to turn on when a unary alarm event occurs.
11. Press + and - to scroll through the list of digital outputs to associate with the alarm.
12. Press **OK** to select a digital output to be associated with the selected alarm.
13. If the selected digital output already has an association that will be lost by making the new selection, a confirmation screen appears.
   — Press **Yes** to accept the changes and return to the previous screen.
   — Press **No** to keep the existing configuration in use and return to the previous screen.
14. Press ▲ to save all alarms selections and return to the previous screen.
15. Press ▲ to save all unary alarm selections.
Setting Up Digital Alarms

To set up digital alarms:

1. Press Dig. The digital alarm Select screen appears.
2. Press ▼ and ▲ to scroll through the list of digital alarms.
3. Press Edit to select an alarm to be configured.
4. Press Edit to select Pickup Setpoint, then press Edit.
5. Press + and - to scroll between On and Off.
6. Press OK to enter the pickup setpoint.
7. Press ▼ to select Pickup Time Delay, then press Edit.
   
   NOTE: If the selected status input mode is Demand Sync or Input Metering, a confirmation screen appears warning that if an alarm is enabled for this status input, the existing association will be broken.

8. Press + to increment the active digit through the numerals 0-9.
   
   NOTE: Units for time delays are set in seconds.

9. Press ▼ to enter the selected value for the active digit and move to the next digit to the left.
10. Continue until all values are selected, then press OK to enter the pickup time delay.
11. Press ▼ to select Dropout Time Delay, then press Edit.
12. Follow Steps 8 to 11 for the dropout time delay.
Setting Up Digital Alarms (continued)

13. Press ▼ to select Enable, then press Edit.

14. Press + and - to scroll between Yes and No.

15. Press OK to enable or disable the alarm.

16. Press ▼ to select Priority, then press Edit.

17. Press + and - to scroll through priority options None, High, Medium, or Low.
   
   **NOTE:** See “Alarm Priorities” on page 64 for more information.

18. Press OK to set the priority.

19. Press ▼ to select Select Digital Output, then press Edit.

20. Press + and - to scroll through the list of digital outputs to associate with the alarm.

21. Press OK to select a digital output to be associated with the selected alarm.

22. If the selected digital output already has an association that will be lost by making the new selection, a confirmation screen appears.
   
   — Press Yes to accept the changes and return to the previous screen.
   
   — Press No to keep the existing configuration in use and return to the previous screen.

23. Press ▲ to save all alarm selections and return to the previous screen.

24. Press ▲ to save all digital alarm selections.
Viewing Alarm Activity and History

There are two types of alarm entries: primary and secondary. The primary entry identifies the alarm. The secondary entries provide pickup and dropout information.

The active alarm list holds 40 entries at a time. The list works as a circular buffer, replacing old entries as new entries over 40 are entered into the alarm event queue. The information in the alarm event queue reinitializes when the power meter resets.

The alarm history log holds 40 entries. The log also works as a circular buffer, replacing old entries with new entries. This information is nonvolatile.

Viewing Active Alarms and Alarm Counters

To view active alarms or alarm counters:

1. Scroll through the menu list at the bottom of the screen until you see Alarm.
2. Press Alarm.
3. Press the button beneath Active or Count.
4. Press ▼ and ▲ to scroll through the alarm list.
5. Press ▲ to return to the previous screen.
Viewing Unacknowledged Alarms and the Alarm History Log

To view the unacknowledged alarms or the alarm history log:

1. Scroll through the menu list at the bottom of the screen until you see **Alarm**.
2. Press **Alarm**.
3. Press the button beneath **Unack** or **Hist**.
4. Press ▼ and ▲ to scroll through the list of primary alarm events.
5. Press **Detail** to view pickup and dropout event details.
6. Press ▼ and ▲ to scroll through the pickup and dropout event details.
7. For unacknowledged alarms, press **Ack** to acknowledge the alarm.
8. Press ▲ to return to the alarm list on the previous screen.
9. For unacknowledged alarms, follow Steps 4 to 7 until all alarms are acknowledged.
Chapter 8—Data Logs

This chapter briefly describes the following logs of the power and energy meter:

- Alarm Log
- User-defined data log

Logs are files stored in the non-volatile memory of the power and energy meter and are referred to as “on-board logs”.

Data Logs

The PM5300 series records and stores readings at regularly scheduled intervals in one independent data log. This log will be in disabled state from the factory. You can set up the data log to store the following information:

- Time Interval: 15, 30, 60 minutes
- First-in-first-out (FIFO) or Fill and Hold
- Values to be logged - up to 2 registers along with data and time of each log entry

The registers list for configuring the data logs

<table>

</tbody>
</table>
Memory Allocation for Log Files

Each file in the power and energy meter has a maximum memory size. Memory is not shared between the different logs, so reducing the number of values recorded in one log will not allow more values to be stored in different log. The following table lists the memory allocated to each log.

<table>
<thead>
<tr>
<th>Log Type</th>

<tr>
<td>Data Log</td>
<td>5760</td>
<td>96+3 D/T</td>
<td>256k</td>
<td>All models</td>
</tr>
</tbody>
</table>

Alarm Log

By default, the power and energy meter can log the occurrence of any alarm condition. Each time an alarm occurs it is entered into the alarm log. The alarm log in the power and energy meter stores the pickup and dropout points of alarms along with the date and time associated with these alarms. With PowerLogic software, user can view and save the alarm log to disk, and reset the alarm log to clear the data out of the power and energy meter’s memory.

Alarm Log Storage

The power and energy meter stores alarm log data in non-volatile memory. The size of the alarm log is fixed at 40 records.
Chapter 9—Measurements and calculations

This section describes how the meter processes measured and calculated data.

Real-time readings

The power and energy meter measures currents and voltages, and reports in real time the RMS (Root Mean Squared) values for all three phases and neutral. The voltage and current inputs are continuously monitored at a sampling rate of 64 points per cycle. This amount of resolution helps enable the meter to provide reliable measurements and calculated electrical values for various commercial, buildings and industrial applications.

Related topics
• To learn how to navigate to the data screens using the front panel, see “Viewing Meter Data” on page 43.

Energy

The power and energy meter calculates and stores accumulated energy values for real, reactive, and apparent energy.

You can view accumulated energy from the display. The energy value units automatically change, based on the quantity of energy accumulated (e.g., from kWh to MWh, from MWh to GWh, then from GWh to TWh, from TWh to PWh).

Related topics
• To view energy readings from the front panel display, see “Meter data display screens” on page 43.

Min/max values

The meter’s real-time readings are updated once every 50 cycles for 50 Hz systems, or once every 60 cycles for 60 Hz systems. When the readings reach their lowest or highest value, the meter updates and saves these min/max (minimum and maximum) quantities in non-volatile memory.

Power factor

Power factor (PF) is the ratio of active power (P) to apparent power (S), and is a number between zero (0) and one (1). In a purely resistive circuit, PF is equal to 1 (unity PF). Inductive or capacitive loads increase the reactive power (Q) component in the circuit which causes the PF to become less than 1.

Power factor can have a positive or negative sign, depending on the type of load or direction of power flow. See “Power factor sign convention” on page 76.
Power factor min/max convention

The meter uses the following convention for power factor minimums and maximums:

- For negative PF readings, the minimum PF value is the measurement closest to -0 for PF readings between -0 to -1. For positive PF readings, the minimum PF value is the measurement closest to +1 for PF readings between +1 to +0.
- For negative PF readings, the maximum PF value is the measurement closest to -1 for PF readings between -0 to -1. For positive PF readings, the maximum PF value is the measurement closest to +0 for PF readings between +1 to +0.

Power factor minimum and maximum

Power factor sign convention

You can set the power factor sign (PF sign) convention by changing the HMI mode to either IEC or IEEE.

Power factor sign convention

<table>
<thead>
<tr>
<th>Quadrant 2</th>
<th>Quadrant 1</th>
<th>Quadrant 2</th>
<th>Quadrant 1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reactive Power In</td>
<td>Reactive Power In</td>
<td>Reactive Power In</td>
<td>Reactive Power In</td>

<td>vars negative (–)</td>
<td>vars negative (–)</td>
</tr>
<tr>
<td>power factor (–)</td>
<td>power factor (+)</td>
<td>power factor (–)</td>
<td>power factor (+)</td>
</tr>
</tbody>
</table>

IEC mode

In IEC mode, the PF sign follows the direction of power flow. PF sign is positive (+) for positive (normal) power flow. PF sign is negative (–) for negative (reverse) power flow.
IEEE mode

In IEEE mode, the PF sign is determined by the type of load (inductive or capacitive) contributing to the reactive power component of apparent power. PF sign is positive (+) for capacitive loads (leading power factor). PF sign is negative (-) for inductive loads (lagging power factor).

- To change the HMI mode, see “Setting up regional settings” on page 37.
- To learn how the meter calculates power factor, see “Power factor” on page 75.

Demand

Demand is a measure of average consumption (typically power or current) over a fixed programmed time interval.

The meter measures instantaneous consumption and can calculate demand using various methods.

Related topics

- For instructions on configuring demand using the front panel, see “Demand setup” on page 41

Power demand calculation methods

Power demand is calculated by dividing the energy accumulated during a specified period by the length of that period. How the power meter performs this calculation depends on the method and time parameters you select (for example, timed rolling block demand with a 15-minute interval).

To be compatible with electric utility billing practices, the power meter provides the following types of power demand calculations:

- Block interval demand
- Synchronized demand
- Thermal demand

You can configure the power demand calculation method from the front panel or using ION Setup.

Block interval demand

For block interval demand method types, you specify a period of time interval (or block) that the power meter uses for the demand calculation. Select/configure how the power meter handles that interval from one of these different methods:

- **Timed Sliding Block**: Select an interval from 1 to 60 minutes (in 1-minute increments). If the interval is between 1 and 15 minutes, the demand calculation updates every 15 seconds. If the interval is between 16 and 60 minutes, the demand calculation updates every 60 seconds. The power meter displays the demand value for the last completed interval.

- **Timed Block**: Select an interval from 1 to 60 minutes (in 1-minute increments). The power meter calculates and updates the demand at the end of each interval.

- **Timed Rolling Block**: Select an interval and a subinterval. The subinterval must divide evenly into the interval (for example, three 5-minute subintervals for a 15-minute interval). Demand is updated at the end of each subinterval. The power meter displays the demand value for the last completed interval.
The following illustration shows the different ways power demand is calculated using the block interval method. In this example, the interval is set to 15 minutes.

**Block interval demand example**

![Diagram showing block interval demand examples](image)

**Synchronized demand**

You can configure the demand calculations to be synchronized using a command sent over communications or the device’s internal real-time clock.

- **Input synchronized demand**: This method allows you to synchronize the demand interval of your meter with an external digital pulse source (such as another power meter’s digital output) connected to your meter’s digital input. This helps synchronize your meter to the same time interval as the other meter for each demand calculation. When setting up this type of demand, you can choose **Input Sync Block** (input-synchronized block demand) or **Input Sync Roll Blk** (input-synchronized rolling block demand). **Input Sync Roll Blk** requires that you specify a subinterval.

- **Command synchronized demand**: This method allows you to synchronize the demand intervals of multiple meters on a communications network. For example, if a programmable logic controller (PLC) input is monitoring a pulse at the end of a demand interval on a utility revenue meter, you can program the PLC to issue a command to multiple meters whenever the utility meter starts a new demand interval. Each time the command is issued, the demand readings of each meter are calculated for the same interval. When setting up this type of demand, you can...
choose **Cmd Sync Block** (command-synchronized block demand) or **Cmd Sync Roll Block** (command-synchronized rolling block demand). **Cmd Sync Roll Blk** requires that you specify a subinterval.

- **Clock synchronized demand**: This method allows you to synchronize the demand interval to the power meter’s internal real-time clock. This helps you synchronize the demand to a particular time, typically on the hour (for example, at 12:00 am). If you select another time of day when the demand intervals are to be synchronized, the time must be specified in minutes from midnight. For example, to synchronize at 8:00 am, select 0800 (in hhmm format). When setting up this type of demand, you can choose **Clock Sync Block** (clock-synchronized block demand) or **Clock Sync Roll Blk** (clock-synchronized rolling block demand). **Clock Sync Roll Blk** requires that you specify a subinterval.

**Thermal demand**

Thermal demand calculates the demand based on a thermal response, which imitates the function of thermal demand meters. The demand calculation updates at the end of each interval. You can set the demand interval from 1 to 60 minutes (in 1-minute increments).

The following illustration shows the thermal demand calculation. In this example, the interval is set to 15 minutes.

**Thermal demand example**

![Thermal demand example diagram](image)

**Current demand**

The power meter calculates current demand using one of the methods described in “Power demand calculation methods” on page 77. You can set the demand interval from 1 to 60 minutes in 1-minute increments (for example, 15 minutes).

**Predicted demand**

The power meter calculates predicted demand for the end of the present interval for kW, kVAR, kVA and Amps demand. This prediction takes into account the energy consumption so far within the present (partial) interval and the present rate of consumption.

Predicted demand is updated every second.

The following illustration shows how a change in load can affect predicted demand for the interval. In this example, the interval is set to 15 minutes.
Peak demand

The maximum values for the kWD, kVARD, kVAD power, and amps (or peak demand) is maintained in the meter's non-volatile memory. The peak for each value is the highest average reading since the meter was last reset. The power meter also stores the date and time when the peak demand occurred. In addition to the peak demand, the power meter also stores the coinciding average 3-phase power factor. The average 3-phase power factor is defined as “demand kW/demand kVA” for the peak demand interval.

Related topics

- To reset peak demand values from the power meter display, see “Single resets” on page 100.
Chapter 10—Multi-tariff feature

This section describes how to set up different tariffs for storing energy values in registers that correspond to each of those tariffs. An example of when this feature can be used is when a utility has set up tariff schedules with different rates based on what day or time of day energy is consumed.

The meter supports configuration of up to 4 different tariffs.

Multi-tariff feature example

In the above illustration, the area under the power curve equals the energy consumed.

Typically, the utility sets tariff schedules so the cost of energy is higher during high demand or high energy consumption times. How these “tariff energy containers” are configured determines how fast these containers fill, which correlates to increasing energy costs. The price per kWh is lowest at tariff T1 and highest at tariff T2.

Multi-tariff feature overview

The meter supports multiple tariffs to measure and monitor energy usage that can be used in billing or cost applications. There are different tariff modes you can use to determine what tariff is applied and when: Command mode, Time of Day mode, and Input mode.
Chapter 10—Multi-tariff feature

Command mode overview

You can use this mode to send a Modbus command to the device which sets the active tariff. This tariff is applied to the measured energy until you send another Modbus command that sets a different tariff.

Related topics

- Search PM5300 Modbus register list at www.schneider-electric.com to download the Modbus map.

Time of day mode overview

You can use this mode to create a tariff schedule that specifies where the meter stores energy or input metered data, based on the time of year (month, day), the type of day (every day, weekend, weekday or a specific day of the week), or time of day. The data collected from the different tariffs can then be used in energy audits or similar costing and budget planning purposes.

Time format

Multi-tariff configuration using the front panel uses this date and time format:

Front panel date and time format

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Values</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Month</td>
<td>1 to 12</td>
<td>The calendar month, where 1 = January, 2 = February, 3 = March, 4 = April, 5 = May, 6 = June, 7 = July, 8 = August, 9 = September, 10 = October, 11 = November, 12 = December.</td>
</tr>
<tr>
<td>Day</td>
<td>1 to 31</td>
<td>The calendar day of the month.</td>
</tr>
<tr>
<td>Time</td>
<td>0000 to 2359</td>
<td>The time in 24-hour clock format, where 0000 = 00:00 (12:00 am) and 2359 = 23:59 (11:59 pm).</td>
</tr>
</tbody>
</table>

NOTE: Use ION Setup if you want to configure Time of Day tariff using the 12-hour clock (i.e., 12:00 am to 11:59 pm).

Tariff validity

A valid tariff has certain conditions and limitations:

- Each tariff must cover a unique time period (tariffs cannot overlap) but there can be periods with no tariff.
- Any number of tariffs, from none to the maximum number of tariffs, can be applied.
- Time of day tariffs do not adjust for daylight savings time.
- Time of day tariffs include February 29th in leap years (however, it is not recommended to have February 29th as a start or end date, as that tariff would be invalid for non-leap years.
- Except for leap years, tariff dates are not year-specific; if you wanted to create a tariff that starts on the first Monday in August, you need to enter the date for that year, then manually update the tariff information for the subsequent years.
Tariff creation method

Your device performs validation checks as you enter tariff information; it prompts you to change the information that you have entered or set the tariff to disabled if the tariff configuration is invalid. These checks can include:

- Start and end times must be different (for example, you cannot create a tariff that starts at 02:00 and also ends at 02:00).
- Start time can only be earlier than end time for tariffs that are applied every day. You can create a daily tariff that starts at 06:00 and ends at 02:00, but these times are only valid for the Everyday tariff and invalid for the other tariff types.
- Start day must be earlier than end day if the days are in the same month. You cannot create a tariff that starts June 15 and ends June 12.

There are two methods of creating tariffs:

- Time of year tariffs divide the year into multiple sections (usually seasons), where each section has one or more day types. For example, a four tariff configuration using this method could have Summer and Winter seasons that also use different weekend and weekday tariffs.
- Daily tariffs can divide days by day of the week, a weekday, a weekend, or every day, and can specify the time of day. For example, a four tariff configuration could have every day in the year divided into six-hour tariff periods or could have two tariffs for weekends and two tariffs for weekdays.

You can combine these methods if, for example you wanted to create a tariff that applies on Mondays from January 1 to June 30, from 09:00 to 17:00. However, since only one tariff can be applied at any time, you cannot use an everyday or weekday tariff type because you already specified a tariff for the time periods 09:00 to 17:00.

Depending on how you configure the tariffs and the maximum number of tariffs supported by your meter, you may not be able to assign tariffs for the entire year, potentially leaving time gaps that do not have any tariff assigned to them.

Example tariff configurations for a four-tariff system

In these examples, four tariffs are used to cover the entire year (there are no time periods that do not have an associated tariff).

Configuration 1: four tariffs with weekdays and weekends

<table>
<thead>
<tr>
<th>Tariff</th>
<th>Type</th>
<th>Start date</th>
<th>End date</th>
<th>Start time</th>
<th>End time</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Weekend</td>
<td>June 21</td>
<td>December 20</td>
<td>00:00</td>
<td>23:59</td>
</tr>
<tr>
<td>2</td>
<td>Weekend</td>
<td>December 21</td>
<td>June 20</td>
<td>00:00</td>
<td>23:59</td>
</tr>
<tr>
<td>3</td>
<td>Weekday</td>
<td>June 21</td>
<td>December 20</td>
<td>00:00</td>
<td>23:59</td>
</tr>
<tr>
<td>4</td>
<td>Weekday</td>
<td>December 21</td>
<td>June 20</td>
<td>00:00</td>
<td>23:59</td>
</tr>
</tbody>
</table>

1 End time of 23:59 is actually 23:59:59, or just before midnight.

All weekend days fall into one of two different tariffs, depending on the date. All weekdays fall into one of two different tariffs, depending on the date. This configuration does not use tariffs based on the time of day, or any day types other than weekend or weekday.

Example dates and corresponding tariffs:

- Friday, June 29 = tariff 3
- Sunday, November 18 = tariff 1
Configuration 2: one season for weekends, with off-peak and shoulder hours, two seasons for weekdays, with shoulder hours

<table>
<thead>
<tr>
<th>Tariff</th>
<th>Type</th>
<th>Start date</th>
<th>End date</th>
<th>Start time</th>
<th>End time</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Every day</td>
<td>January 1</td>
<td>December 31</td>
<td>23:00</td>
<td>04:59</td>
</tr>
<tr>
<td>2</td>
<td>Weekdays</td>
<td>May 1</td>
<td>September 30</td>
<td>05:00</td>
<td>22:59</td>
</tr>
<tr>
<td>3</td>
<td>Weekdays</td>
<td>October 1</td>
<td>April 30</td>
<td>05:00</td>
<td>22:59</td>
</tr>
<tr>
<td>4</td>
<td>Weekends</td>
<td>January 1</td>
<td>December 31</td>
<td>05:00</td>
<td>22:59</td>
</tr>
</tbody>
</table>

All days have a tariff applied between 23:00 and 04:59, corresponding to off-peak hours. All weekend days have a tariff applied from 05:00 to 22:59, corresponding to shoulder hours. All weekdays fall into one of two seasons (summer or winter), and have two tariffs applied throughout the day. Example dates and corresponding tariffs:

- Wednesday, March 21, 08:00 = tariff 3
- Tuesday, January 10, 21:00 = tariff 3
- Sunday, June 24, 14:00 = tariff 4
- Friday, August 17, 00:00 = tariff 1

Input mode overview

You can use this mode to have the device’s digital inputs set which tariff is applied to the energy that is presently being consumed. If a digital input is used for multi-tariff, it cannot be used for an exclusive association (such as Demand Sync or Input Metering), but digital inputs can be shared with a non-exclusive association (such as Alarms). To make a digital input available for setting tariffs, any conflicting associations must be manually removed at the source of the original association.

The number of different tariffs that can be applied is determined by the number of available digital inputs and the total number of tariffs supported by your device. The digital inputs are used as binary counters to identify the appropriate tariff, where off = 0 and on = 1, and most significant bit (MSB) is digital input 2 and least significant bit (LSB) is digital input 1. By this definition, digital input 1 must be associated with the multi-tariff feature in order to set the tariff to Input mode.

Digital input requirements for required number of tariffs

1 This digital input configuration (00) means there are no active tariffs (all tariffs are disabled)
Configuring tariffs using the front panel

This section explains how to use the front panel to set up tariffs.

**Tariff setup menu tree**

You can change the tariff mode using the front panel.

When the meter is set to command mode for tariffs, the active tariff is controlled by Modbus commands sent from your energy management system or other Modbus master.

**Related topics**

- Search PM5300 Modbus register list at www.schneider-electric.com to download the Modbus map.

Configuring time of day mode tariffs using the front panel

When the meter is set to time of day for tariffs, the active tariff is determined by the day type, the start and end times, and the start and end dates. The time of day tariff is not a calendar; the meter does not calculate the corresponding day of the week to a specific date, but February 29th is considered a valid date if you are programming the meter during a leap year.

When you enter tariff times using the front panel, be aware that the displayed minute value includes the entire minute. For example, an end time of 01:15 includes the time from 01:15:00 through 01:15:59. To create a tariff period that starts right after this, you must set the next tariff’s start time to 01:16. Although it may appear that there is a gap between these tariffs, there is not.

1. Navigate to **Maint > Setup**.
2. Enter the setup password (default is “0”), then press **OK**.
3. Navigate to **Meter > Tariff**.
4. With the cursor pointing to **Mode**, press **Edit**.
5. Press + or − to change the setting to **Time of Day**, then press **OK**.
6. Move the cursor to point to the tariff (Tariff 1 to Tariff 4) you want to modify, then press **Edit**.

**Time of day mode tariff setup**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Values</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Day Type</td>
<td>Everyday, Weekday, Weekend, Monday, Tuesday, Wednesday, Thursday, Friday, Saturday or Sunday</td>
<td>Select which day the tariff is active. Only tariffs that are Everyday can have a tariff that includes midnight (for instance, from 11pm to 2am).</td>
</tr>
<tr>
<td>Start Time</td>
<td>0000 to 2359</td>
<td>Set the time when the tariff period starts, using the 24 hour clock format (00:00 to 23:59). The Start Time cannot equal the End Time.</td>
</tr>
<tr>
<td>End Time</td>
<td>0000 to 2359</td>
<td>Set the time when the tariff period ends, using the 24 hour clock format (00:00 to 23:59). The End Time cannot equal the Start Time.</td>
</tr>
</tbody>
</table>
7. Modify each parameter as required, then press OK to set. Press ▼ or ▲ to move between parameters.

8. Press ▲ to exit, then Yes to save your changes. Repeat for the other tariffs as required. The meter checks the configuration and display a message if any tariffs have conflicting settings (i.e., overlapping tariff periods).

**Configuring input mode tariffs using the front panel**

When you set the tariff type to Input, the active tariff is determined by the status of the digital inputs.

Digital inputs are available for tariffs if they are not used, or if they are only associated with alarms (Normal). To make a digital input available, you must manually disconnect the conflicting association before configuring tariffs.

You cannot configure any digital input tariff if digital input 1 is not available for association. Likewise, digital input 2 must be available to select more than two tariffs. The status of the digital inputs is used to calculate the binary value of the active tariff, where off = 0 and on = 1. The calculation of the number of tariffs value can differ, depending on the number of digital inputs that can be selected (i.e., inputs that can be associated with multi-tariff).

To configure input mode tariffs using the front panel:

1. Navigate to Maint > Setup.
2. Enter the setup password (default is "0"), then press OK.
4. With the cursor pointing to Mode, press Edit.
5. Press + or − to change the setting to Input, then press OK.

**NOTE:** If a digital input association error prompt displays, you must exit from the tariff setup screens and remove the digital input association.

6. Navigate to Tariffs, then press Edit.
7. Press + or − to change the number of tariffs you want to set up. The maximum number of tariffs that you can apply is determined by the number of available digital inputs, as described in the table, “Digital input requirements for required number of tariffs” on page 84. Press OK.

8. Navigate to Inputs, then press Edit.
9. If applicable, press + or − to change how many digital inputs you want to use to control which tariff is selected (active). Press OK.
10. Press ▲ to exit, then Yes to save your changes.
Chapter 11—Power quality

This section describes the meter’s power quality features and how to access power quality data.

The meter measures voltage and current harmonics up to the 31st harmonic, and calculates Total Harmonic Distortion (THD) and Total Demand Distortion (TDD and tdd).

Harmonics overview

Harmonics are integer multiples of the fundamental frequency of the power system. Harmonics information is valuable for power quality analysis, determining properly rated transformers, maintenance and troubleshooting.

Harmonics measurements include per-phase magnitudes and angles for the fundamental and higher harmonics relative to the fundamental frequency. The meter’s power system setting defines which phases are present and determines how line-to-line or line-to-neutral voltage harmonics and current harmonics are calculated.

Harmonics data provide information to determine how non-linear loads affect the power system. For example, power system harmonics can cause current flow on the neutral conductor, increase heating in electric motors, and eventually damage connected equipment. Power conditioners or harmonic filters can be used to minimize unwanted harmonics.

Total Harmonic Distortion and Total Demand Distortion

Total Harmonic Distortion (THD) is a measure of the total per-phase voltage or current harmonic distortion present in the power system. It provides a general indication of the quality of a waveform. THD is calculated for each phase of both voltage and current.

Total Demand Distortion (TDD) is the per-phase harmonic current distortion against the full load demand of the electrical system. TDD indicates the impact of harmonic distortion in the system. For example, if your system is showing high THD values but a low demand, the impact of harmonic distortion on your system might be insignificant. However at full load, the THD value for the current harmonics is equal to TDD, so this could negatively impact your system.

The meter uses the following series of equations to calculate THD and TDD.

Harmonic content calculations

1. Calculate harmonic content (HC).

\[ HC = \sqrt{(H2)^2 + (H3)^2 + (H4)^2 + \ldots} \]

HC (harmonic content) is equal to the RMS value of all the non-fundamental harmonic components in one phase of the power system.

2. Calculate the harmonic content for current (HCl).

\[ HCl = \sqrt{(H12)^2 + (H13)^2 + (H14)^2 + \ldots} \]

HCl (harmonic content current) is equal to the RMS value of all the non-fundamental current harmonic components \((H12...H1n)\) in one phase of the power system.
THD and thd calculations

The meter supports two methods of calculating total harmonic distortion: THD and thd.

**THD** is a quick measure of the total distortion present in a waveform and is the ratio of harmonic content to the fundamental. The meter uses the following equation to calculate THD:

\[
THD = \frac{HC}{H_1} \times 100
\]

Where \( H_1 \) is equal to the fundamental harmonic.

**thd** is an alternate method for calculating total harmonic distortion. It uses the RMS value for the total harmonic content rather than the fundamental content. The meter uses the following equation to calculate thd:

\[
thd = \frac{HC}{\sqrt{(H_1)^2 + (HC)^2}} \times 100
\]

**TDD calculation**

**TDD** (total demand distortion) evaluates the harmonic currents between an end user and a power source. The harmonic values are based on a point of common coupling (PCC), which is a common point where each user receives power from the power source. The meter uses the following equation to calculate TDD:

\[
TDD = \left( \frac{\sqrt{(HC_{IA})^2 + (HC_{IB})^2 + (HC_{IC})^2}}{I_{Load}} \right) \times 100
\]

Where \( I_{Load} \) is equal to the maximum demand load on the power system.

**Displaying harmonics data**

The meter displays the numeric magnitude and angle of the fundamental (first) harmonic.

**Viewing harmonics using the front panel**

You can view harmonics data using the front panel.

1. Navigate to Harm. The Harmonics % screen displays, with the following menu options:

   **Harmonics % display screens**

<table>
<thead>
<tr>
<th>IEEE mode</th>
<th>IEC mode</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>V L-L</td>
<td>U</td>
<td>Line-to-line voltage harmonics data</td>
</tr>
<tr>
<td>V L-N</td>
<td>V</td>
<td>Line-to-neutral voltage harmonics data</td>
</tr>
<tr>
<td>Amps</td>
<td>I</td>
<td>Current harmonics data</td>
</tr>
<tr>
<td>TDD</td>
<td>TDD</td>
<td>Total demand distortion</td>
</tr>
</tbody>
</table>

2. Press the voltage or current harmonics you want to view. The fundamental (1st) harmonic’s numeric magnitudes and angles for all phases are displayed.

3. Press 3-11, 13-21, or 23-31 to view the graphs for the 3rd to 11th, 13th to 21st, or 23rd to 31st harmonics, respectively. For example, to display the 13th to 21st harmonics screen, press 13-21.
Example: 13th to 21st harmonics for line-to-neutral voltage

The vertical axis of the harmonics graph indicates the harmonic's magnitude as a percentage of the fundamental harmonic, and is scaled based on the largest harmonic displayed. At the top of each vertical bar is a marker that shows the maximum value of the harmonic. If the harmonic is greater than the fundamental harmonic, this marker is triangular-shaped to show that the value is out of range.

Viewing TDD

1. Navigate to Harm > TDD. The Total demand distortion information displays.

   **Power Quality display screen**

<table>
<thead>
<tr>
<th>IEEE mode</th>
<th>IEC mode</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TDD</td>
<td>TDD</td>
<td>Total demand distortion</td>
</tr>
</tbody>
</table>

   **NOTE:** Your meter’s Modbus map includes registers for harmonics data for integration into your power or energy management system.

2. Press ▲ to return to the main display screens.

Related topics

Chapter 12—Verifying accuracy

All meters are tested and verified at the factory in accordance with International Electrotechnical Commission (IEC) and American National Standards Institute (ANSI) standards.

Your digital power meter does not require re-calibration. However, in some installations a final accuracy verification of the meters is required, especially if the meters will be used for revenue or billing applications.

Testing overview

The most common method for testing meter accuracy is to apply test voltages and currents from a stable power source and compare the meter’s readings with readings from a reference device or energy standard.

Accuracy test requirements

Signal and power source

The meter maintains its accuracy during voltage and current signal source variations but its energy pulsing output needs a stable test signal to help produce accurate test pulses. The meter’s energy pulsing mechanism needs approximately 10 seconds to stabilize after every source adjustment.

The meter must be connected to control power in order to conduct accuracy verification testing. Refer to your meter’s installation documentation for power supply specifications.

Control equipment

Control equipment is required for counting and timing the pulse outputs from the alarm / energy pulsing LED or the digital outputs.

- Most standard test benches have an arm equipped with red light sensors to detect LED pulses.
- The reference device or energy standard typically has digital inputs that can detect and count pulses coming from an external source (i.e., the meter’s digital output).

NOTE: The optical sensors on the test bench can be disrupted by strong sources of ambient light (such as camera flashes, florescent tubes, sunlight reflections, floodlights, etc). This can cause test errors. Use a hood, if necessary, to block out ambient light.

Environment

The meter should be tested at the same temperature as the testing equipment. The ideal temperature is about 23 °C (73 °F). Make sure the meter is warmed up sufficiently before testing.
A warm-up time of 30 minutes is recommended before beginning energy accuracy verification testing. At the factory, the meters are warmed up to their typical operating temperature before calibration to help ensure that the meters will reach their optimal accuracy at operating temperature.

Most high precision electronic equipment requires a warm up time before it reaches its specified performance levels. Energy meter standards allow the manufacturers to specify meter accuracy derating due to ambient temperature changes and self-heating.

Your meter complies with and meets the requirements of these energy metering standards.

For a list of accuracy standards that your meter complies to, contact your local Schneider Electric representative or download the meter brochure from www.schneider-electric.com.

Reference device or energy standard

To help ensure the accuracy of the test, it is recommended that you use a reference device or reference energy standard with a specified accuracy that is 6 to 10 times more accurate than the meter under test. Before you start testing, the reference device or energy standard should be warmed up as recommended by its manufacturer.

**NOTE:** Verify the accuracy and precision of all measurement equipment used in accuracy testing (for example, voltmeters, ammeters, power factor meters).

Energy pulsing

You can configure the meter’s alarm / energy LED or one of the digital outputs for energy pulsing.

- The meter is equipped with an alarm / energy pulsing LED. When configured for energy pulsing, the LED emits pulses that are then used to determine the accuracy of the meter’s energy measurements.

**Location of energy pulsing LED**

- The meter is equipped with digital outputs. When you configure a digital output for energy pulsing, the meter sends voltage pulses to the digital output port, which are then used to determine the accuracy of the meter’s energy measurements.
Verifying accuracy test

The following are guidelines for testing the meter; your meter shop may have specific testing methods.

<table>
<thead>
<tr>
<th>DANGER</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>HAZARD OF ELECTRIC SHOCK, EXPLOSION OR ARC FLASH</strong></td>
</tr>
<tr>
<td>• Apply appropriate personal protective equipment (PPE) and follow safe electrical work practices. See NFPA 70E in the USA or applicable local standards.</td>
</tr>
<tr>
<td>• Turn off all power supplying this device before working on it.</td>
</tr>
<tr>
<td>• Always use a properly rated voltage sensing device to confirm that all power is off.</td>
</tr>
<tr>
<td>• Do not exceed the device’s ratings for maximum limits.</td>
</tr>
<tr>
<td>• Verify the device’s power source meets the specifications for your device’s power supply.</td>
</tr>
</tbody>
</table>

**Failure to follow these instructions will result in death or serious injury.**

1. Turn off power to all test equipment. Use a properly rated voltage sensing device to confirm power is off.

2. Connect the test voltage and current source to the reference device or energy standard. Ensure all voltage inputs to the meter under test are connected in parallel and all currents inputs are connected in series.

3. Connect the control equipment used for counting the standard output pulses using one of these methods:

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Alarm / energy LED</td>
<td>Align the red light sensor on the standard test bench armature over the front panel alarm / energy LED.</td>
</tr>
<tr>
<td>Digital output</td>
<td>Connect the meter’s digital output to the standard test bench pulse counting connections.</td>
</tr>
</tbody>
</table>

**NOTE:** When selecting which method to use, be aware that the Alarm / energy LED and digital outputs have different pulse rate limits. See “Energy pulsing considerations” on page 97 for details.

4. Before performing the verification test, let the test equipment power up the meter and apply voltage for at least 30 seconds. This helps stabilize the internal circuitry of the meter.

5. Set the meter’s power system to 3PH4W Wye Gnd (3-phase, 4 wire Wye with ground).
6. Depending on the method selected for counting the energy pulses, configure the 
   meter’s alarm / energy LED or one of the digital outputs to perform energy pulsing. 
   Set the meter’s energy pulse constant so it is in sync with the reference test 
   equipment.

7. Perform accuracy verification on the test points. Run each test point for at least 30 
   seconds to allow the test bench equipment to read an adequate number of pulses. 
   Allow 10 seconds of dwell time between test points.

**Calculating the number of required pulses**

The reference test equipment typically requires you to specify the number of pulses 
required for a test duration of “t” seconds.

Use the following formula to calculate the required number of pulses:

\[
\text{Number of pulses} = \frac{P_{\text{tot}} \times K \times t}{3600}
\]

Where:
- \( P_{\text{tot}} \) = total instantaneous power in kilowatts (kW)
- \( K \) = the meter’s pulse constant setting, in pulses per kWh
- \( t \) = test duration, in seconds (typically greater than 30 seconds)

**Calculating total power**

The test voltage and current source supplies the same test signals to both the energy 
reference/standard and the meter under test. Total power is calculated as follows:

For a balanced 3-phase Wye system:

\[
P_{\text{tot}} = 3 \times V_{\text{LN}} \times I \times PF \times \frac{1 \text{ kW}}{1000 \text{ W}}
\]

**NOTE:** A balanced 3-phase system assumes the voltage, current and power factor 
values are the same for all phases.

For a single-phase system:

\[
P_{\text{tot}} = V_{\text{LN}} \times I \times PF \times \frac{1 \text{ kW}}{1000 \text{ W}}
\]

Where:
- \( P_{\text{tot}} \) = total instantaneous power in kilowatts (kW)
- \( V_{\text{LN}} \) = test point line-to-neutral voltage in volts [V]
- \( I \) = test point current in amps [A]
- \( PF \) = power factor

The result of the calculation is rounded up to the nearest integer.

**Percent error calculation**

For every test point:

\[
\text{Energy Error} = \frac{EM - ES}{ES} \times 100\%
\]
Where:

- EM = energy measured by the meter under test
- ES = energy measured by the reference device or energy standard.

**NOTE:** If accuracy verification reveals inaccuracies in your meter, they may be caused by typical sources of test errors. If there are no sources of test errors present, please contact your local Schneider Electric representative.

### Energy pulsing considerations

The meter’s alarm / energy LED and digital outputs are capable of energy pulsing within the following limits:

#### Energy pulsing limits

<table>
<thead>
<tr>
<th>Description</th>
<th>Alarm / energy LED</th>
<th>Digital output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Maximum pulse frequency</td>
<td>50 Hz</td>
<td>25 Hz</td>
</tr>
<tr>
<td>Minimum pulse constant</td>
<td>1 pulse per k_h</td>
<td></td>
</tr>
<tr>
<td>Maximum pulse constant</td>
<td>9,999,999 pulses per k_h</td>
<td></td>
</tr>
</tbody>
</table>

The pulse rate depends on the voltage, current and PF of the input signal source, the number of phases, and the VT and CT ratios.

If Ptot is the instantaneous power (in kW) and K is the pulse constant (in pulses per k\_h), then the pulse period is:

\[
Pulse\ period\ (in\ seconds) = \frac{3600}{K \times Ptot} = \frac{1}{\text{Pulse\ frequency\ (Hz)}}
\]

#### VT and CT considerations

The test points are always taken at the secondary side, regardless of whether VTs or CTs are used. Ptot is derived from the values of the voltage and current inputs at the secondary side, and takes into account the VT and CT ratios.

If VTs and CTs are used, you must include their primary and secondary ratings in the equation. For example, in a balanced 3-phase Wye system with VTs and CTs:

\[
Ptot = 3 \times VLN \times \frac{VT\ primary}{VT\ secondary} \times I \times \frac{CT\ primary}{CT\ secondary} \times PF \times \frac{1\ kW}{1000\ W}
\]

#### Total power limit for alarm / energy LED

Given the maximum pulse constant (Kmax) you can enter is 9,999,999 pulses per kWh, and the maximum pulse frequency for the alarm / energy LED is 83 Hz, the maximum total power (Max Ptot) the alarm / energy LED’s energy pulsing circuitry can handle is 29.88 Watts:

\[
\text{Maximum Ptot} = \frac{3600 \times \text{(Maximum pulse frequency)}}{Kmax} = \frac{3600 \times 83}{9,999,999} = 0.02988\ kW
\]

#### Total power limit for digital output

Given the maximum pulse constant (Kmax) you can enter is 9,999,999 pulses per kWh, and the maximum pulse frequency for the digital output is 25 Hz, the maximum total power (Max Ptot) the digital input’s energy pulsing circuitry can handle is 9 Watts:
Test points

The meter should be tested at full and light loads and at lagging (inductive) power factors to help ensure testing over the entire range of the meter. The test amperage and voltage input rating are labeled on the meter. Refer to the installation sheet or data sheet for your meter’s nominal current, voltage and frequency specifications.

Watt-hour test points example

<table>
<thead>
<tr>
<th>Watt-hour test point</th>
<th>Sample accuracy verification test point</th>
</tr>
</thead>
<tbody>
<tr>
<td>Full load</td>
<td>100% to 200% of the nominal current, 100% of the nominal voltage and nominal frequency at unity power factor or one (1).</td>
</tr>
<tr>
<td>Light load</td>
<td>10% of the nominal current, 100% of the nominal voltage and nominal frequency at unity power factor or one (1).</td>
</tr>
<tr>
<td>Inductive load (lagging power factor)</td>
<td>100% of the nominal current, 100% of the nominal voltage and nominal frequency at 0.50 lagging power factor (current lagging voltage by 60° phase angle).</td>
</tr>
</tbody>
</table>

Var-hour test points example

<table>
<thead>
<tr>
<th>Var-hour test point</th>
<th>Sample accuracy verification test point</th>
</tr>
</thead>
<tbody>
<tr>
<td>Full load</td>
<td>100% to 200% of the nominal current, 100% of the nominal voltage and nominal frequency at zero power factor (current lagging voltage by 90° phase angle).</td>
</tr>
<tr>
<td>Light load</td>
<td>10% of the nominal current, 100% of the nominal voltage and nominal frequency at zero power factor (current lagging voltage by 90° phase angle).</td>
</tr>
<tr>
<td>Inductive load (lagging power factor)</td>
<td>100% of the nominal current, 100% of the nominal voltage and nominal frequency at 0.87 lagging power factor (current lagging voltage by 30° phase angle).</td>
</tr>
</tbody>
</table>

Typical sources of test errors

If excessive errors are observed during accuracy testing, examine your test setup and test procedures to eliminate typical sources of measurement errors:

- Loose connections of voltage or current circuits, often caused by worn-out contacts or terminals. Inspect terminals of test equipment, cables, test harness and the meter under test.
- Meter ambient temperature is significantly different than 23 °C (73 °F).
- Floating (ungrounded) neutral voltage terminal in any configuration with unbalanced phase voltages.
- Inadequate meter control power, resulting in the meter resetting during the test procedure.
- Ambient light interference or sensitivity issues with the optical sensor.
- Unstable power source causing energy pulsing fluctuations.
- Incorrect test setup: not all phases connected to the reference device or the energy standard. All phases connected to the meter under test should also be connected to the reference meter/standard.
- Moisture (condensing humidity), debris or pollution present in the meter under test.
Chapter 13—Meter resets

Reset commands clear the meter’s onboard data logs and related registers. Meter resets are typically performed after you make changes to the meter’s basic setup parameters (such as power system, frequency, or PT/CT settings), to clear invalid or obsolete data in preparation for putting the meter into active service.

The meter reset commands are grouped into two categories: Global Resets and Single Resets.

---

### Front panel meter reset screens

To access the meter reset screens, navigate to **Maint > Reset**.

**Reset menu tree**

**Global resets**

Global resets allow you to clear all data of a particular type, such as all energy values or all minimum/maximum values.

**Meter Initialization** is a special command that clears the meter’s recorded logged data, counters and timers. It is common practice to initialize the meter after its configuration is completed, before adding it to an energy management system.

1. Navigate to **Maint > Reset**.
2. Move the cursor to point to **Global Reset**, then press **Select**.
3. Move the cursor to point to the parameter you want to reset, then press **Reset**.

**Global reset options**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Meter Initialization</td>
<td>Clears all data listed in this table (energy, demand, min/max values, counters, logs, timers, and input metering data).</td>
</tr>
<tr>
<td>Energies</td>
<td>Clears all accumulated energy values (kWh, kVARh, kVAh).</td>
</tr>
<tr>
<td>Demands</td>
<td>Clears all the demand registers.</td>
</tr>
<tr>
<td>Min/Max</td>
<td>Clears all the minimum and maximum registers.</td>
</tr>
<tr>
<td>Alarm Counts &amp; Logs</td>
<td>Clears all the alarm counters and alarm logs.</td>
</tr>
<tr>
<td>I/O Counts &amp; Timers</td>
<td>Clears all the I/O counters and resets all the timers.</td>
</tr>
</tbody>
</table>

4. Enter the reset password (default is “0000”), then press **OK**.

---

**NOTICE**

**LOST DATA**

Record all important data before performing meter resets. Failure to follow these instructions can result in data loss.
5. Press **Yes** to confirm the reset or **No** to cancel and return to the previous screen.

## Single resets

Single resets allow you to clear data only in a specific register or register type.

1. Navigate to **Maint > Reset**.
2. Move the cursor to point to **Single Reset**, then press **Select**.
3. Move the cursor to point to the parameter you want to reset, then press **Reset**. If there are additional options for the parameter, press **Select**, move the cursor to point to the option you want, then press **Reset**.

### Single reset options

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Energy</td>
<td>Accumulated</td>
<td>Clears all accumulated energy values (kWh, kVARh, kVAh).</td>
</tr>
<tr>
<td>Demand</td>
<td>Power, Current</td>
<td>Select which demand registers to clear (power demand, current demand or input metering demand).</td>
</tr>
<tr>
<td>Alarms</td>
<td>Event Queue</td>
<td>Clears the alarm event queue register.</td>
</tr>
<tr>
<td></td>
<td>History Log</td>
<td>Clears the alarm history log.</td>
</tr>
<tr>
<td></td>
<td>Counters</td>
<td>All Alarm Counts, (various alarm counters) — see the next table</td>
</tr>
<tr>
<td>Status Inputs</td>
<td>Timers</td>
<td>All Dig In Timers, Status Input S1, Status Input S2</td>
</tr>
<tr>
<td></td>
<td>Counters</td>
<td>All Dig In Counters, Status Input S1, Status Input S2</td>
</tr>
<tr>
<td>Digital Outputs</td>
<td>Timers</td>
<td>All Dig Out Timers, Digital Output D1, Digital Output D2, Relay R1, Relay R2</td>
</tr>
<tr>
<td></td>
<td>Counters</td>
<td>All Dig Out Counters, Digital Output D1, Digital Output D2, Relay R1, Relay R2</td>
</tr>
<tr>
<td>Active Load Timer</td>
<td></td>
<td>Clears and restarts the load operation timer.</td>
</tr>
<tr>
<td>Multi-Tariff</td>
<td></td>
<td>Clears accumulated values in all tariff register.</td>
</tr>
</tbody>
</table>

4. Enter the reset password if prompted (default is “0000”), then press **OK**.
5. Press **Yes** to confirm the reset or **No** to cancel and return to the previous screen.

### Alarm counter options

Chapter 14—Maintenance and Upgrades

Password Recovery

If you lose your password, contact technical support for password recovery assistance:

- Global-PMC-Tech-support@schneider-electric.com
- (00) + 1 (250) 544-3010

**NOTE:** Be sure to include your power meter’s serial number in your e-mail or have it readily available when calling technical support.

Power Meter Memory

The power meter uses its nonvolatile memory to retain all data and metering configuration values. Under the operating temperature range specified for the power meter, this nonvolatile memory has an expected life of at least 45 years.

**NOTE:** Life expectancy is a function of operating conditions and does not constitute any expressed or implied warranty.

Identifying the Firmware Version, Model, and Serial Number

1. Scroll to [Maint] in the menu list.
2. Press [Maint].
3. Press [Diag].
4. Press [Info].
5. Press ▼ and ▲ to view the model, firmware (OS) version, serial number, and other power meter information.
6. Press ▲ to return to the Maintenance screen.
Additional Meter Status Information

**Meter**

1. Scroll to [Maint] in the menu list.
2. Press [Maint].
3. Press [Diag].
4. Press [Meter].
5. View the power meter status.
6. Press ▲ to return to the Maintenance screen.

**Control Power**

1. Scroll to [Maint] in the menu list.
2. Press [Maint].
3. Press [Diag].
4. Press [Cl Pwr].
5. View control Power information.
6. Press ▲ to return to the Maintenance screen.

**Downloading Firmware**

The power meter supports the downloading of new firmware and language files over the communications link. This requires the free DLF3000 software, which is available at www.schneider-electric.com. The DLF3000 offers an extensive Help file with information on operating the software. The most recent firmware and language files are also available on the website.
Troubleshooting

The information in Table 14–1 on page 106 describes potential problems and their possible causes. It also describes checks you can perform or possible solutions for each. After referring to this table, if you cannot resolve the problem, contact your local Schneider Electric sales representative for assistance.

### DANGER

**HAZARD OF ELECTRIC SHOCK, EXPLOSION, OR ARC FLASH**

- Apply appropriate personal protective equipment (PPE) and follow safe electrical practices. For example, in the United States, see NFPA 70E.
- This equipment must be installed and serviced only by qualified personnel.
- Turn off all power supplying this equipment before working on or inside.
- Always use a properly rated voltage sensing device to confirm that all power is off.
- Carefully inspect the work area for tools and objects that may have been left inside the equipment.
- Use caution while removing or installing panels so that they do not extend into the energized bus; avoid handling the panels, which could cause personal injury.

**Failure to follow these instructions will result in death or serious injury.**

#### Heartbeat/Comms LED

The heartbeat/comms LED helps to troubleshoot the power meter. The heartbeat/comms LED works as follows:

- **Normal operation** — the LED flashes at a steady rate during normal operation.
- **Communications** — the LED flash rate changes as the communications port transmits and receives data. If the LED flash rate does not change when data is sent from the host computer, the power meter is not receiving requests from the host computer.
- **Hardware** — if the heartbeat LED remains lit and does not flash ON and OFF, there is a hardware problem. Perform a hard reset of the power meter (turn OFF power to the power meter, then restore power to the power meter). If the heartbeat LED remains lit, contact your local sales representative.
- **Control power and display** — if the heartbeat LED flashes, but the display is blank, the display may not be functioning properly or may have timed out (see “Setting Up the Display” on page 8). If the display is blank and the LED is not lit, verify that control power is connected to the power meter.

</tr>
<tr>
<td>Energy/Alarm LED not working.</td>
<td>May have been disabled by user.</td>
<td>See “Setting up the alarm / energy pulsing LED” on page 40.</td>
</tr>
</tbody>
</table>

The power meter does not contain any user-serviceable parts. If the power meter requires service, contact your local sales representative. Do not open the power meter. Opening the power meter voids the warranty.

Getting Technical Support

Please refer to the Technical Support Contacts provided in the power meter shipping carton for a list of support phone numbers by country, or go to www.schneider-electric.com, then navigate to Support area for contact information.

Register List

To download the latest version of the power meter PM5300 Modbus register list, go to www.schneider-electric.com. Type PM5300 in the search field.
Glossary

Terms

accumulated energy—energy accumulates as either delivered to the customer or received from the customer.
active alarm—an alarm that has been set up to trigger the execution of a task or notification when certain conditions are met. An icon in the upper-right corner of the power meter indicates that an alarm is active (!).
ASCII—American Standard Code for Information Interchange
baud rate—specifies how fast data is transmitted across a network port.
block interval demand—demand calculation method for a block of time; includes sliding block, fixed block, or rolling block method.
communications link—a chain of devices connected by a communications cable to a communications port.
current transformer (CT)—current transformer for current inputs.
debounce time—amount of time an input must be consistently on before the transition is accepted as valid.
demand—average value of a quantity, such as power, over a specified interval of time.
device address—used to identify a device on the Modbus communications link; defines where the power meter resides in the power monitoring system.
energy delivered—the utility delivers energy to the facility; energy in.
energy received—the utility receives energy from the facility; the customer provides power to the utility; energy out.
event—the occurrence of an alarm condition, such as Undervoltage Phase A, configured in the power meter.
firmware—operating system within the power meter.
fixed block—a demand calculation method using an interval selected from 1 to 60 minutes (in 1-minute increments). The power meter calculates and updates the demand at the end of each interval.
frequency—number of cycles in one second.
GMT—Greenwich Mean Time
lagging current (I)—current is lagging voltage up to 180°.
leading current (I)—current is leading voltage up to 180°.
lagging power factor (PF)—active and reactive power flowing in the same directions.
leading power factor (PF)—active and reactive power flowing in opposite directions.
line-to-line voltages—measurement of the rms line-to-line voltages of the circuit.
line-to-neutral voltages—measurement of the rms line-to-neutral voltages of the circuit.
maximum value—highest value recorded of the instantaneous quantity such as Phase A Current, Phase A Voltage, etc., since the last reset of the minimums and maximums.
minimum value—lowest value recorded of the instantaneous quantity such as Phase A Current, Phase A Voltage, etc., since the last reset of the minimums and maximums.
nominal—typical or average.
parity—refers to binary numbers sent over the communications link. An extra bit is added so that the number of ones in the binary number is either even or odd, depending on your configuration. Used to detect errors in the transmission of data.
partial interval demand—equal to energy accumulated thus far in the interval divided by the length of the complete interval.

peak demand current—highest demand current measured in amperes since the last reset of demand.

peak demand real power—highest demand real power measured since the last reset of demand.

peak demand—highest demand measured since the last reset of demand.

phase currents (rms)—measurement in amperes of the rms current for each of the three phases of the circuit.

phase rotation—refers to the order in which the instantaneous values of the voltages or currents of the system reach their maximum positive values. Two phase rotations are possible: A-B-C or A-C-B.

potential transformer (PT)—also known as a voltage transformer (VT).

power factor (PF)—power factor is the degree to which voltage and current to a load are out of phase. Total power factor is the difference between the total power your utility delivers and the portion of total power that does useful work. True power factor is the ratio of real power to apparent power using the complete harmonic content of real and apparent power. Calculated by dividing watts by volt amperes. Displacement power factor is the cosine of the angle between the fundamental components of current and voltage, which represents the time lag between fundamental voltage and current.

real power—calculation of the real power (3-phase total and per-phase real power calculated) to obtain kilowatts.

rms—root mean square. Power meters are true rms sensing devices.

rolling block—a selected interval and subinterval that the power meter uses for demand calculation. The subinterval must divide evenly into the interval. Demand is updated at each subinterval, and the power meter displays the demand value for the last completed interval.

sliding block—an interval selected from 1 to 60 minutes (in 1-minute increments). If the interval is between 1 and 15 minutes, the demand calculation updates every 15 seconds. If the interval is between 16 and 60 minutes, the demand calculation updates every 60 seconds. The power meter displays the demand value for the last completed interval.

thermal demand—demand calculation based on thermal response.

Total Demand Distortion (TDD)—indicates the harmonic currents between an end user and a power source.

Total Harmonic Distortion (THD or thd)—indicates the degree to which the voltage or current signal is distorted in a circuit.

total power factor—see power factor.

true power factor—see power factor.

unary alarm—an alarm based on singular events or specific conditions for which setpoints are not appropriate.

voltage transformer (VT)—also known as a potential transformer (PT).
Abbreviations

A—Ampere
Amps—Amperes
Comms—Communications
CPT—Control Power Transformer
CT—Current Transformer
D In—Digital Input
D Out—Digital Output
DMD—Demand
DO—Drop Out
F—Frequency
GMT—Greenwich Mean Time
Hz—Hertz
I—Current
I/O—Input/Output
Imax—Current maximum demand
kVA—Kilovolt-Ampere
kVAD—Kilovolt-Ampere demand
kVAR—Kilovolt-Ampere reactive
kVARD—Kilovolt-Ampere reactive demand
kVARH—Kilovolt-Ampere reactive hour
kW—Kilowatt
kWD—Kilowatt demand
kWH—Kilowatthours
kWH/P—Kilowatthours per pulse
kWmax—Kilowatt maximum demand
Mag—Magnitude
Maint—Maintenance
Min—Minimum
MnMx—Minimum and maximum values
MSec—Milliseconds
MVAh—Megavolt ampere hour
MVARh—Megavolt ampere reactive hour
MWh—Megawatt hour
OS—Operating System (firmware version)
P—Real power
Pd—Real power demand
PF—Power factor
PM—Power meter
PQS—Real, reactive, apparent power
PQSD—Real, reactive, apparent power demand
Prim—Primary
PT—Potential Transformer (also known as VT—Voltage Transformer)
PU—Pick Up
Pulse—Pulse output mode
Pwr—Power
Q—Reactive power
Qd—Reactive power demand
RS—Firmware reset system version
S—Apparent power
SN—Power meter serial number
Sd—Apparent power demand
Sec—Secondary
Sub-I—Subinterval
TDD—Total Demand Distortion
THD—Total Harmonic Distortion
U—Voltage line to line
V—Volts
VT—Voltage Transformer (also known as PT—Potential Transformer)
VAR—Volt ampere reactive
Vmax—Maximum voltage
Vmin—Minimum voltage
