1 Introduction

Protection devices in the MiCOM 30 series are described in detail in the respective operating manuals as regards technical properties, functional characteristics, and proper handling during installation, connection, commissioning, and operation. However, the operating manuals do not provide any information regarding the philosophy behind each specific product or the way in which the functional possibilities of a particular protection device can be used to handle special applications.

The present application guide for the Redundant Ethernet Board is intended to close such gap. The purpose is to give the reader a better understanding of the design of the individual function blocks and then to provide related instructions for settings and application.

The redundant Ethernet board assures redundancy at IED level. For safety information please see the Safety Section of the relevant Px3x IED Technical Manual.

Figure 01: MiCOM Px3x redundant Ethernet board, project view
2 Hardware description

Two boards are available for using IEC61850, the single Ethernet board and the redundant Ethernet board. Both are required for communications but the redundant Ethernet board allows an alternative path to be always available, providing bumpless redundancy.

Industrial network failure can be disastrous. Redundancy provides increased safety and reliability, but also devices can be added to or removed from the network without network downtime.

2.1 Px3x Redundancy protocols

The following list shows Schneider Electric’s implementation of Ethernet redundancy, which has three variants with embedded IEC 61850, plus SHP, RSTP and DHP redundancy protocols.

- **Rapid Spanning Tree Protocol (RSTP IEEE 802.1w)** 1300 nm multi mode 100BaseFx fiber optic Ethernet ports (ST® connector) and modulated IRIG-B input.
  
  Note: This board offers compatibility with any RSTP device.

- **Self Healing Protocol (SHP)** 1300 nm multi mode 100BaseFx fiber optic Ethernet ports (ST® connector) and modulated IRIG-B input.
  
  Note: This board offers compatibility with C264-SWR202 and MiCOM H35x multi-mode switches. Self healing Protocol is a Schneider Electric proprietary solution providing extremely fast recovery time.

- **Dual Homing Protocol (DHP)** 1300 nm multi mode 100BaseFx fiber optic Ethernet ports (ST® connector) and modulated IRIG-B input
  
  Note: This board offers compatibility with C264-SWD202 and MiCOM H36x multi-mode switches. Dual Homing Protocol is a Schneider Electric proprietary solution providing bumpless redundancy to the IED.

All of these boards have connections for a watchdog relay and an RS485 link.

The redundant Ethernet board is fitted into Slot 2 of the IED. Each Ethernet board has two MAC addresses, one for the managed embedded switch and one for the IED.

2.2 Modules

The MiCOM Px3x devices are constructed from standard hardware modules. The following table lists the item numbers of the three variants of the Redundant Ethernet board:

<table>
<thead>

3 Redundancy protocols

There are three redundancy protocols available:

- RSTP (Rapid Spanning Tree Protocol)
- SHP (Self Healing Protocol)
- DHP (Dual Homing Protocol)

3.1 Rapid spanning tree protocol (RSTP)

RSTP is a standard used to quickly reconnect a network fault by finding an alternative path, allowing loop-free network topology. Although RSTP can recover network faults quickly, the fault recovery time depends on the number of devices and the topology. The recovery time also depends on the time taken by the devices to determine the root bridge and compute the port roles (discarding, learning, forwarding). The devices do this by exchanging Bridge Protocol Data Units (BPDUs) containing information about bridge IDs and root path costs. See the IEEE 802.1w standard for further information.

The Px3x redundant Ethernet board uses the RSTP protocol, so a Px3x can attach onto a network as shown in Figure 04.

The RSTP solution is based on open standards. It is therefore compatible with other Manufacturers’ IEDs that use the RSTP protocol. The RSTP recovery time is typically 300 ms but it increases with network size. However, the Schneider Electric dual homing protocol (DHP) solution and Schneider Electric self healing protocol (SHP) solution respond to the constraints of critical time applications such as GOOSE.
3.2 Self healing protocol (SHP)

SHP is applied to double ring network topologies. When a fiber is broken, both end stations detect the break. Using both the primary and redundant networks the ring is automatically reclosed.

The MiCOM Px3x, C264 and H35x are repeaters with a standard 802.3 Ethernet switch plus the self healing manager (SHM). Figure 06 shows the internal architecture of such a device.

The SHM functions manage the ring. If the fiber optic connection between two devices is broken, the network continues to run correctly.

Normally the Ethernet packets travel on the primary fiber in the same direction, and only a checking frame (4 octets) is sent every 5 μs on the secondary fiber in the opposite direction.

If the link goes down, both SHM's immediately start the network self-healing. At one side of the break, received messages are no longer sent to the primary fiber but are sent to the secondary fiber. On the other
side of the break, messages received on the secondary fiber are sent to the primary fiber and the new
topological loop is closed in less than 1 ms.

It is therefore possible to extend the number of devices, or the size of a sub-station network, without stopping
the network. The loop is opened and it self heals, then new equipment is connected and it self heals again,
closing the loop.

To increase the reliability some specific mechanisms are used:

- The quality of transmission is monitored. Each frame (Ethernet packet or checking frame) is
  controlled by the SHM.
- Even if there is no traffic in the primary link, the secondary link is still supervised by sending out
  checking frames every 5 μs.

![SHP ring architecture with Px3x, C264 and Hx5x switches](image1)

![SHP ring architecture with Px3x, C264 and Hx5x switches with failure](image2)
3.3 Dual homing protocol (DHP)

The dual homing mechanism functions manage the double star. If the optical fiber connection between two devices is broken, the network continues to operate correctly.

The dual homing mechanism handles topologies where a device is connected to two independent networks. One is the main link, the other is the backup. Both are active at the same time.

In sending mode, packets from the device are sent by the DHM to the two networks. In receive mode, the duplicate discard principle is used. This means that when both links are up, the MiCOM H36x receives the same Ethernet frame twice. The Dual Homing Manager transmits the first frame received to upper layers for processing, and the second frame is discarded. If one link is down, the frame is sent through the link, received by the device, and passed to upper layers for processing.

Schneider Electric’s dual homing mechanism fulfills automation requirements by delivering a very fast recovery time for the entire network (less than 1 ms).

To increase reliability some specific mechanisms are used:

- Each frame carries a sequence number which is incremented and inserted into both frames.
- Specific frames are used to synchronize the discard mechanism.

![Diagram of Dual Homing Mechanism](image)

The MiCOM H36x is a repeater with a standard 802.3 Ethernet switch, plus the dual homing manager. Figure 10 shows the internal architecture of such a device.
Figure 10: Internal architecture of MiCOM IEDs, and C264 and H36x switches

Figure 11: Application of dual homing star at substation level
3.4 **Generic functions for all redundant Ethernet boards**

The following apply to all three redundant Ethernet protocols (RSTP, SHP and DHP).

**Ethernet 100Base Fx**

The fiber optic ports are full duplex 100 Mbps ST connectors.

**Forwarding**

The MiCOM Px3x, C264, Hx1x and Hx5x switches support store and forward mode. The MiCOM switch forwards messages with known addresses to the appropriate port. The messages with unknown addresses, the broadcast messages and the multicast messages are forwarded out to all ports except the source port. MiCOM switches do not forward error packets, 802.3x pause frames or local packets.

**Priority tagging**

802.1p priority is enabled on all ports.

**Simple Network Management Protocol - SNMP**

Simple Network Management Protocol (SNMP) is the network protocol developed to manage devices in an IP network. SNMP relies on a Management Information Base (MIB) that contains information about parameters to supervise. The MIB format is a tree structure, with each node in the tree identified by a numerical Object IDentifier (OID). Each OID identifies a variable that can be read or set using SNMP with the appropriate software. The information in the MIBs is standardized.

**Redundant Ethernet board MIB Structure**

The SNMP MIB consists of distinct OIDs, each of which refers to a defined collection of specific information used to manage devices on the SCHNEIDER ELECTRIC network. The SCHNEIDER ELECTRIC MIB uses three types of OID (sysDescr, sysUpTime and sysName).

Table 07: Remote monitoring (RMON) Structure

Various SNMP client software tools can be used with the MiCOM Px3x, C264 and Hx5x range. Schneider Electric recommends using an SNMP MIB browser which can perform the basic SNMP operations such as GET, GETNEXT, RESPONSE.

To access the network using SNMP, use the IP address of the embedded switch in the redundant Ethernet board. See section 4.2.

Simple Network Time Protocol - SNTP

Simple Network Time Protocol is supported by both the IED and the redundant Ethernet switch. SNTP is used to synchronize the clocks of computer systems over packet-switched, variable-latency data networks. A jitter buffer is used to reduce the effects of variable latency introduced by queuing in packet switched networks, ensuring a continuous data stream over the network.

The IED receives the synchronization from the SNTP server. This is done using the IP address of the SNTP server entered into the IED from the IED Configurator software.
4 Configuration

An Internet Protocol (IP) address is a logical address assigned to devices in a computer network that uses the Internet Protocol for communication between nodes. IP addresses are stored as binary numbers but they are usually displayed in the following format.

10.86.254.85

Both the IED and the redundant Ethernet board have their own IP address. Figure 12 shows the IED as IP1 and the redundant Ethernet board (REB) as IP2. Note that IP1 and IP2 must be different and in the same subnet mask.

The switch IP address must be configured through the network.

![Diagram of IED and redundant Ethernet board IP address configuration](image)

4.1 Configuring the IED IP address

The IP address of the IED is configured using the IED Configurator software in MiCOM S1 Studio. If using IEC 61850 the IED IP address is set using the IED Configurator. The available range is 1 to 254 in the last octet of the IED IP address. It is recommended to select an octet from the range 128 to 254 to avoid a potential equality with the board IP address.

Note: In the IED Configurator, set the port type to Copper, not Fiber.

4.2 Configuring the board IP address

The IP address of the redundant Ethernet board is configured in both software and hardware, as shown in Figure 12. Therefore this must be configured before connecting the IED to the network to avoid an IP address conflict.

Configuring the first two octets of the board IP address

If using Self Healing Protocol or Dual Homing Protocol, the first two octets are configured using Switch Manager or an SNMP MIB browser (see section 3.4). An H35 (SHP) or H36 (DHP) network device is needed in the network to configure the Redundant Ethernet Board IP address using SNMP.

If using Rapid Spanning Tree Protocol, the first two octets are configured using the RSTP Configurator software tool or using an SNMP MIB browser.
Configuring the third octet of the board IP address
The third octet is fixed at 254, regardless of the protocol.

Configuring the last octet of the board IP address
The last octet is configured using address switches on the board. The available address range is 1 to 127. See Figure 13.

Figure 13: Redundant Ethernet board address switches

Example address
decimal 85

\[1 + 4 + 16 + 64 = 85\]

4.3 Switch Manager Software
For further information see the Switch Manager Operation Guide.

4.4 RSTP Configurator software
A global software description is provided in Appendix 1: RSTP Configurator
5 Commissioning

5.1 SHP ring connection
Connect Es to Rs and Ep to Rp until it makes a ring, as shown in Figure 14.

![Figure 14: Dual Ethernet ring connections](image)

5.2 DHP star connection
Connect Tx to Rx and Rx to Tx on each device as shown in Figure 15.

![Figure 15: Dual Ethernet star connections](image)
5.3 RSTP ring connection

Figure 16 shows IED 1 to IED n with the RSTP variant of redundant Ethernet boards connected in a ring topology. The ring topology can have one or more high-end RSTP-enabled Ethernet switches to interface with another network or control center. The Ethernet switch is an RSTP enabled switch with a higher number of ports.

The Ethernet switch, which is connected to the controlling PC, should be configured as the root bridge. The bridge priority of the Ethernet switch should be configured to the minimum value in the network.

The maximum number of IEDs that can be connected in the ring network depends on the Max Age parameter configured in the root bridge.

The Max Age parameter can be varied from 6 to 40 seconds.

If Max Age = 6 seconds, the maximum number of IEDs in the ring is 6 – 1 = 5.
If Max Age = 40 seconds, the maximum number of IEDs in the ring is 40 – 1 = 39.

Therefore the number of IEDs that can be connected in the ring can vary from 5 to 39.

Figure 16: Dual Ethernet ring topology
5.4 RSTP star connection

Figure 17 shows IED 1 to IED n with the RSTP variant of redundant Ethernet boards connected in a star topology. The star topology can have one or more high-end RSTP-enabled Ethernet switches to interface with other networks, control centers, or IEDs. The Ethernet switch is an RSTP enabled switch with a greater number of ports. The Ethernet switch, which is connected to the controlling PC, should be configured as the root bridge. The bridge priority of the Ethernet switch should be configured to the minimum value in the network.

The IEDs are placed at two hop distance from the root bridge, therefore the Max Age parameter has no impact on star topology.

The maximum number of IEDs that can be connected in the star network depends on the number of ports available in the Ethernet switch, provided that the hop count from the root bridge is less than the Max Age parameter.

Figure 17: Dual Ethernet star and ring topology
5.5 Large RSTP networks combining star and ring

Figure 18 shows a star of four rings. Each ring is connected to the root bridge. The root bridge is a high-end RSTP enabled bridge with the maximum number of ports as required. The devices A1, A2…Anmax, B1, B2…Bnmax, C1, C2…Cnmax, D1, D2…Dnmax, represent the RSTP variant of redundant Ethernet boards.

The maximum number of boards that can be connected in single ring in an RSTP-enabled network depends on the Max Age parameter. The hop count from the root bridge can not be greater than the Max Age parameter.

The maximum number of RSTP bridges in a ring is given by

\[ N_{\text{max}} = (\text{Max Age} - 1) \]

Where:

- \( N_{\text{max}} \) = maximum number of devices in a ring
- \( \text{Max Age} \) = Max Age value configured in the root bridge.

Assuming the default value of Max Age as 20 seconds in the topology, the maximum number of devices that can be connected in ring A is 19.
If Max Age is configured as 40 seconds, the maximum number of IEDs that can be connected in the network is \((40-1) = 39\). According to the IEEE 802.1w standard, the maximum value for the Max Age parameter is limited to 40. To use the maximum number of IEDs in the ring, the following configuration should be used.

- **Max Age**: 40 seconds
- **Forward Delay**: 30 seconds
- **Hello Time**: 2 seconds
- **Bridge Priority**: As required by the end user.

The IEEE 802.1w standard defines the relation between Max Age and Forward Delay as:

\[
2 \times (\text{Forward Delay} - 1.0 \text{ seconds}) \geq \text{Max Age}
\]

To have the maximum number of nodes in the RSTP network, the number of rings can be increased, depending on the number of ports available in the root bridge.

---

**Figure 18**: Combined RSTP star and ring topology
6 Technical Data

The technical data applies to a redundant Ethernet board fitted into IEDs listed in chapter 1.

6.1 100 Base FX Interface (in accordance with IEEE802.3 and IEC 61850)

Optical fibers (-X7, -X8, -X14, -X15):
   BFOC-(ST®)-interface 2.5 per IEC 60874-10-1 per glass fiber

Glass fiber connection G 50/125
   Optical wavelength: typ. 1308 nm
   Optical output: min. –23.5 dBm
   Optical sensitivity: min. -31 dBm
   Optical input: max. -14 dBm

Glass fiber connection G 62.6/125
   Optical wavelength: typ. 1308 nm
   Optical output: min. -20 dBm
   Optical sensitivity: min. -31 dBm
   Optical input: max. -14 dBm

6.2 Serial Interface COMM2

Leads (X10):
   Threaded terminal ends M2 for wire cross sections up to 1.5 mm²

Protocol per IEC 60870-5-103
Transmission rate: 300...57600 bit/s (settable)

6.3 IRIG-B Interface

Format B122,
Amplitude modulated, 1 kHz carrier signal,
BCD time-of-year code

6.4 Fiber defect connector (watchdog relay)

Rated voltage: 250 VDC, 250 VAC
Continuous current: 5 A
Short-duration current: 30 A and carry for 3 s
Breaking capacity AC:
   1500 VA resistive (cos ϕ = unity)
   1500 VA inductive (cos ϕ = 0.5)

Breaking capacity DC:
   50 W, 250 VDC resistive
   25 W inductive (L/R=40 ms)
7 Cortec

Below cortec (partial example) covers all Px3x IEDs using the redundant Ethernet board. Using redundant Ethernet board for Px30 requires the new power supply unit PSU 2 with order identifiers as listed below.

2) IEC61850 redundant connection with power supply options E to M only

Table 08: Cortec for Px3x IEDs using the redundant Ethernet board
Appendix 1: RSTP Configurator

When running the RSTP protocol, the RSTP Configurator software is used to identify a device, configure the IP address, configure the SNTP IP address and configure RSTP settings.

A1.1 Connecting the IED to a PC

Connect the IED to the PC on which RSTP Configurator will run. This connection is done through an Ethernet switch or through a media converter. See Figure below.

Connection using (a) an Ethernet switch and (b) a media converter

A1.2 Installing RSTP configurator

Double click WinPcap_4_0.exe to install WinPcap.

Double click Schneider Electric RSTP Configurator.msi to install the RSTP Configurator. The setup wizard appears. Click Next and follow the on-screen instructions to run the installation.

A1.3 Starting the RSTP configurator

To start the RSTP Configurator, select Programs > RSTP Configurator > RSTP Configurator. The Login screen appears.

For user mode login, enter the Login name as User and click OK with no password. If the login screen does not appear, check all network connections.

The main window of the RSTP Configurator appears. The Network Board drop-down list shows the Network Board, IP Address and MAC Address of the PC in which the RSTP Configurator is running.
A1.4 Device identification

To configure the redundant Ethernet board, go to the main window and click Identify Device.

Note: Due to the time needed to establish the RSTP protocol, it is necessary to wait 25 seconds between connecting the PC to the IED and clicking the Identify Device button.

The redundant Ethernet board connected to the PC is identified and its details are listed.

- Device address
- MAC address
- Version number of the firmware
- SNTP IP address
- Date & time of the real-time clock, from the board.
A1.5  IP address configuration

To change the network address component of the IP address, go to the main window and click the IP Config button.

The Device setup screen appears. The first three octets of the board IP address can be configured. The last octet is set using the switches.

Enter the required board IP address and click OK.

The board network address is updated and displayed in the main window.
A1.6 SNTP IP address configuration

To configure SNTP server IP address, go to the main window and click the SNTP Config button. The Device setup screen appears.

Enter the required SNTP MAC and server IP address. Then click OK.

The updated SNTP server IP address appears in the main screen.
A1.7 Equipment

To view the MAC addresses learned by the switch, go to the main window and click the **Identify Device** button. The selected device MAC address then appears highlighted.

Click the **Equipment** button. The list of MAC addresses learned by the switch and the corresponding port number are displayed.
A1.8 RSTP configuration

To view or configure the RSTP Bridge Parameters, go to the main window and click the device address to select the device. The selected device MAC address appears highlighted.

Click the RSTP Config button. The RSTP Config screen appears.

To view the available parameters in the board that is connected, click the Get RSTP Parameters button.

RSTP configuration parameters ranges and default values
Bridge parameters

To read the RSTP bridge parameters from the board, go to the main window and click the device address to select the device. The RSTP Config window appears and the default tab is Bridge Parameters.

Click the Get RSTP Parameters button. This displays all the RSTP bridge parameters from the Ethernet board.

To modify the RSTP parameters, enter the values and click Set RSTP Parameters.

To restore the default values, click Restore Default and click Set RSTP Parameters. The grey parameters are read-only and cannot be modified.

Port parameters

This function is useful if you need to view the parameters of each port.

From the main window, click the device address to select the device and the RSTP Config window appears.

Select the Port Parameters tab, and then click Get Parameters to read the port parameters. Alternatively, select the port numbers to read the parameters.
Port states
This is used to see which ports of the board are enabled or disabled.

From the main window, click the device address to select the device. The **RSTP Config** window appears.

Select the Port States tab then click the Get Port States button. This lists the ports of the Ethernet board. A tick shows they are enabled.
